It just baffles me why so many people think that it is a good idea to make getting a ham license as big of a pain in the ass as possible. Tests, tests, and more tests, and for what? Why not have one theory/reg test that tests whether an applicant can safely and legally operate his station, and leave it at that. This crazy maze of tests that we have lacks any rational basis. I have seen no evidence, none, that taking more tests makes us better hams. To the contrary, the hobby sucks nowadays because there are hardly any new hams. 20M SSB, as I've observed in the past, sounds like a geriatric ward.

I know of no other hobby that seeks to discourage newcomers the way ours does. Kind of an indication of the innate anti-social tendencies of many hams, particularly in the ARRL. They just don't like people.

No YOU don't get it! Why? BECAUSE IT IS A REQUIREMENT! You ARE whining. If
you don't want to learn code then take your sorry ass back to channel 19.
But just SHUT UP about it! You want to up-grade? Learn the code. Its that
simple. You won't EVER get it changed. There are allot more of us than
there are of you. Get it? Now, GO STUDY YOUR CODE!

I knew when I wrote the above that someone with a total lack of logic
would again offer the reason that "BECAUSE IT IS A
REQUIREMENT" is the self justifying reason.

> You ARE whining. If
>you don't want to learn code then take your sorry ass back to channel 19.

Check my license Mr Joe.

>But just SHUT UP about it! You want to up-grade? Learn the code. Its that

>simple.

Been there, done tha...now what do you say?

> You won't EVER get it changed.

Change it will, it is just a matter of when.

> There are allot more of us than
>there are of you. Get it?

Careful now. If you don't see the steady shift away
from code support then you are incredibly naive. The
ARRL survey resulted in a majority, but nowhere of
the same magnitude as was the case even 5
years ago. The volume of nocode license holders
continues to increase while coded classes barely
remain constant in numbers. Additionally,
with time, more and more traditionalists will die
off also.

>Now, GO STUDY YOUR CODE!

And for you loser Cecil and Bill Sohl and Gary and most of the others
who propose removing the code hazing are in fact Advanced or higher.

Too much wetware decoding kill your ability to read a callbook or do you just like being ignorant.

You attitude and shining example make me want to get the old key out, they sure do. BTW code has not done much for your spelling.

5 years ago we didn't have a welfare license.

>The volume of nocode license holders continues to increase

Recent statistics posted here have indicated that even the codeless license is beginning to see a drop off in interest (i.e. the pool of people who were going to be attracted to amateur radio by the codeless license have already become licensed.)

This, coupled with the fact that the codeless license is now considered the "entry level" license in amateur radio suggests at most the levels might increase marginally, but not substantially, over the next 5 years.

>while coded classes barely remain constant in numbers. Additionally,
>with time, more and more traditionalists will die
>off also.

Since nobody has posted anything suggesting what the attrition rate
through death is in the higher license classes, we'll have to assume
it is linear. If, as you suggest, the coded license classes have
"barely remained constant", this suggests that an equal number of
people are gaining higher license classes as those who are dying off.

I have no problem with code being a requirement. I think it offers those
who do not know code a challenge or goal to work towards in order to gain
more privileges. It stresses technical competency.

Just because one doesn't know code doesn't make them a "loser". I don't
know code (yet), but I am still a licensed amateur radio operator. I enjoy
the friendly people on the local people, and I occassionally make a dx
contacts with a friendly ham. I'm just happy that, and I really hate to
use this expression, "assholes" like K4XA aren't one of the people I have
spoken with.

Just because you may know code doesn't make you high and mighty. You have
just found the time to learn code. Some people like myself have 2 jobs and
could barely find the time to study for and take the no-code tech exam.
The code will come in time, and once I learm it I will find the common
decency to help others along in a more professional manner, rather than
condemn them for not knowing code.

Sir, I seriously doubt that your name is Joe Mama. I challenge you to drop
the alias and come back to the real world. Use your knowledge to help
others along and be a bit more professional in you explanation of why
certaian things are required. Although you know code, you put your pants
on the same way I and all of the other no-code techs do - one leg at a
time.

> It (code) stresses technical competency.

Hi Bryan, in no way does Morse code stress technical competency. It
is a skill and cannot be classified as technical. IMO, the only reason
that it is kept as a testing requirement is a welfare benefit for the
technically handicapped who couldn't pass a reasonable technical exam.
The fact that Len Winkler's WOG suggestion hasn't been taken seriously
pretty much proves it. How would it hurt the hobby to allow tech+'s who
can pass all the written exams through extra, access to HF? It certainly
would help the hobby to balance the black box operators with some technical
talent.

The pro-coders can't answer that. That's why they have to resort to whining
"It's a requirement" as if that were carved in stone on a tablet delivered to
Hiram Percy Maxim by a burning bush. Of course WRC-99 is scheduled to
review the issue and there is a call for a showing of *compelling* reasons to
retain S25.5.

None of the pro-code whiners can come up with one of course, so they can only
act like little schoolyard brats and whine "It's the rules, it's the rules" as if
that
will have any impression on the *rulemakers*. Those who make the rules are
intelligent enough to recognize a circular argument when they hear one.

The truth is that the ITU has already agreed to end the requirement for Morse
speed testing for every radio service except amateur (and that exception is
only because no WRC has addressed amateur rules in the last decade). No
compelling arguments could be made for its retention in any other service. In
1999 it will be amateur radio's turn to face the ITU and try to convince them to
retain the Morse speed testing requirement exclusively for amateur radio. If
the life safety services couldn't make a case for it, amateurs are going to find
it very hard to do so despite the whining of the pro-coders.

Looks like a long, heated and varying argument and one that I have chosen not to become a part of...until now.

Because I didn't think I could comment until I had experienced both sides of the argument.

I got my No-Code Technician license on 3/10/97 and yesterday (5/3/97) upgraded to Extra when I passed my 1C test. The code requirement scared me to death when I got into this and I figured I would be on VHF/UHF for a long time before dipping down into HF land. That was not the case.

I am no CW expert, that's for sure. I have never even made a CW QSO, but with a little study each day for a month and a half, the test was doable. As for carrying on a QSO at 20 wpm, not going to happen. Not by me and not for a long time. CW is a language and until you have the reflex to hear -.-. [dah di dah di] and C [see] with the same speed and comprehension, you just can't do it comfortably.

So, for the folks that think they can't do the code, you really can. In these modern times in which we live, you shouldn't have to, but you can. Study it, learn it, pass the test and forget about it if it's not your cup of tea. Get your Extra and then give some of the old guys static for not upgrading their General or Advanced tickets. :)

I don't think the code requirement will be dropped for a while and if they go back to 1 minute perfect copy for the tests, it will be a lot harder.

Peace!

That is exactly what the old foggie pro-coders rely on.
Keeping the code requirement insures them that the HF airwaves
will not be used by anyone under 65 years of age. They don't
have the time to waste learning CW!

It isn't a language, Howard, foreign or otherwise. It is just an encoding
of alphabet, no different in principle from ASCII, Baudot, or EBDIC.
And it is quite crude compared to those other encodings. That's why
it has been abandoned by the rest of the communicaitons world as a
method of text transmission. Amateur radio is the last holdout against
modernization. That *should* be an embarrassment to any amateur
not locked in the throes of religious frenzy and bent on keeping amateur
radio in the Dark Ages.

There was an initial surge of pent up demand when the code test free
Tech license was created which, of course, wasn't sustainable. But
the fact remains that amateur radio is now growing at a rate considerably
higher than in the 70s and 80s, and that's very good news indeed.

>>while coded classes barely remain constant in numbers. Additionally,

Actually, the information has been posted several times. The amateur license class with the highest average age is General, followed by Extra, Advanced, Novice, and the two Tech classes. The average age spread between General and Tech is 20 years. Unless we have some reason to believe that the life expectency of Generals is much greater than Techs, there's no doubt that the older amateurs are going to die off sooner than the younger ones. This demographic shift is inevitable. Some Techs are upgrading, but the rate of upgrade is much lower than the rate of entry, so we're seeing a shift in the balance of power in amateur radio toward the VHF+ amateur and away from the HF amateur.

>Hiram Percy Maxim by a

Typical anti-code "welfare state" rhetoric.

CW remains a requirement because the mode of operation is one of the

most popular on HF, surpassed only by SSB, and we don't have a SSB test
because the FCC assumes most people know how to push a button and speak
into a microphone.

When CW diminishs to be a popular HF mode, surpassed by other modes
(such as up-and-coming digital modes) then it is entirely reasonable to
replace the CW examination with an examination on another mode.

[blah blah blah, yada yada yada ...
more hate-filled rhetoric from Gary deleted]

>The truth is that the ITU has already agreed to end the requirement for Morse
>speed testing for every radio service except amateur (and that exception is
>only because no WRC has addressed amateur rules in the last decade). No
>compelling arguments could be made for its retention in any other service.

Q: Why exactly has the ITU agreed to end the requirement for Morse for every
radio service?

A: Because those services have adopted other modes of operation and have
by their actions eliminated morse.

Q: How does this differ from the Amateur Service?

A: The amateur service continues to use Morse heavily on HF.

Q: So what?

A: When morse use on HF declines, and other modes surpass it, then the
time will arrive to eliminate the examination.

Hi Bryan,

Sorry if you thought it was harsh, or if it offended you. But, according to your post, you intend to LEARN the code. So my post was not directed at you. Only the people who DON'T intend to learn it but continue to gripe about it. Also, to answer your question, it is required because the code is the simple core of amateur communications. If all else fails, you can still send code. Bottom line is it doesn't matter WHY its required. Only that it IS required. You don't have to be an ace at the code to upgrade. Its not that hard. And sorry, but it does not require that much time. I have 2 kids myself so I don't have much time at all. It requires effort and commitment and thats why most people piss and moan about it. Good luck, hope you get the up-grade you want.

Hi Bill,

Yes I can, just didn't care what class you held. The code is required because it is amateur communication in its simplest form. Its the core of the hobby. Now, can we please DROP IT!

I guess using the name CrACKeD is the height of bravery! By the way, they already have a hobby where the code is not required. Its called CB.

No smiley, so I don't know if this is an attempt at humor or not. Obviously, since the tech test is easier than the extra test, the extras are going to be more RF savvy. What I am saying is there would be many, many more extras if the Morse code testing requirement was lifted. I personally know about 25 degreed engineers with tech/general/advanced licenses who would upgrade to extra in a minute if it weren't for the Morse code testing requirement.

I've been away from this group for a few months. Coming down from a 30,000 ft. level it's pretty obvious that the Morse code testing requirement is the welfare state gift to technically challenged hams and most of the whining is coming from those hams given something for nothing by merely demonstrating a skill unrelated to and void of knowledge of electronics. To all who don't fall into that catagory, I'm not talking about you.

But I was just agreeing with you...

>Obviously, since the tech test is easier than the extra test, the
>extras are going to be more RF savvy. What I am saying is there would
>be many, many more extras if the Morse code testing requirement was
>lifted.

Ah, but that's nothing like what you said originally:

>>...If Morse code testing were eliminated,
>>the hobby would be populated by RF electronic engineers and that
>>would make all the electronically ignorant hams miserable.

Nothing whatsoever about extras. Since the Morse test *has been* lifted in the Tech case your words would lead one to expect the Tech ranks to "be populated by RF electronic engineers" to a greater degree than the other coded classes.

> I personally know about 25 degreed engineers with
>tech/general/advanced licenses who would upgrade
>to extra in a minute if it weren't for the Morse code testing
>requirement.

So now the entire complaint is that they can't use the small Extra segments?! Do they perhaps need to conduct their propagation studies on 7.005 rather than 7.030?
>
>I've been away from this group for a few months. Coming down from a
>30,000 ft. level it's pretty obvious that the Morse code testing
>requirement is the welfare state gift to technically challenged hams

Hmmm, don't know what to make of that statement. Didn't you say just above that the Extra <written implied> test was *harder* than the no-code test? Contradictions abound...

Actually, you might be confusing cause and effect here. Perhaps the ONLY
reason CW remains a popular mode is because the requirement still exists.
I've heard a lot of accusations of "welfare state whining" leveled against
the no-code people, but the pro-code rhetoric seems to follow the same idea
of welfare-state entitlements: You can't take away "our" bands and give
them to no-code people whose only claim to them is that they know the
technical aspects of radio -- they MUST learn code."

CW is diminishing, and the CW testing is given far more weight than the
mode deserves even with its historical roots. If you don't "know" SSB, you
can still get an HF license. If you don't know ATV, PACTOR, AMTOR, RTTY,
GTOR, or may of the other modes, you still can upgrade. Antiquated CW is
the ONLY PASS-FAIL mode. This simply is not right.

SSB HAS surpassed HF. Go ahead and eliminate the exam! Pull the exam, and
watch the use of CW fall to its natural level.

Having read the latest load posted in this string, including many from the
above poster, I have come to the conclusion that he has realized that he is
unable to defend his position in a rational manner, and wants to drop the
discussion before he loses.

Yes, CW is required now. Some say the requirement will be dropped "over
their dead body" -- perhaps that is what it will take. But why run ham
radio into the ground just to hang on to this testing for on obsolete means
of communication? Senseless!

Does that mean that learning Morse Code is smartening up amateur radio?
Emulating a piece of hardware and learning something that can probably
be taught to apes is an accomplishment?

> Much like the liberals want to do
> America? You can always be a CB operator you know. They don't require code.
> Burden of proof is on the prosecution. You show me any good reason to drop

Spoken like a true redneck. Are you sure you aren't a CBer that stole
somone else's callsign? You sound a lot like channel 19.

Larry hit it on the mark based upon your latest tirade. Also based
upon your blind faith in Morse Code as opposed to knowledge in modern
communications you've demonstrated in your other posts, you'd appear
to be a prime example of any dumbing down that has gone on. Apparently
it is better to pound brass than hit the books.

73,
Todd

When I went off the air eight years ago (bad case of computeritis), the Joplin MO hamfest was eight tables and a quart of ice cream in a local park.

Two weeks ago, I attended the current Joplin hamfest... a full convention center, over 200 tables rented, over 800 hams attending.

I was a charter member of the sponsoring club when it was founded seventeen years ago by a new Novice class. I served as club president there, also a president of a repeater club, published a monthly newsletter, sold a few articles to Wayne Gteene, and editorialized against the use of a truly outdated mode as a touchstone, a requirement for advancement. Even the Merchant Marine has quit requiring ratiotelegraph operators on shipboard. Sidebnd and digital communications have come of age.

Requiring code was, I argued, equicalent to requiring hams to build all of their gear, and have the station passed by an inspector prior to liciensing. There's nothing wrong with homebrew, but following the state of the art on your own is very difficult, and rarely seen these days. KUDOS to those who build their own multi-band, multi-mode receivers (I know one ham who does, and does a beautiful job of it), but the public officials here are most impressed by the legion of VHF stations which stand ready to track severe storms and provide early warning to local communities.

When I was licensed in 1979, some hams were upset by the "flood" of ex-CBers taking ham tests. The code test began losing all meaning back then as copies of official tests became available as "practice tapes." Then, the early volunteer examination program was riddled with corruption I know serveral "11-meter pirates" who co8uldn't honestly copy 5 wpm, yet hold Extra-Class tickets. Guess what? These guys almost all went on to set up digipeaters, ATV nets, emergency phone patches, and otherwise live up to the tradition of service of the ham community.

Today, I listen to the legion of no-code techs, and hear competent operating practices, on-aur courtesy, and nothing that should make any amateur ashamed to display his or her license. I see, with the expansion of the hobby, Radio Shack getting re-involved with equipment and training, and more small specialty manufacturers opening their doors.

The new bunch are communicators by nature, often coming from the computer world now, instead of Class D Citizen's Band. They often take as much pride in their staions, theor operaing practices, and their public service as any Olde Pharte who had to slog eighty miles through ten-foot snow drifts on their bellies to take a code test in front of an FCC engineer.

Somehoe, despite the interia of the ARRL, the hobby is again viable.
Thank Goodness!

Not a bad idea. It certainly would ensure people know what they are doing.

>There's nothing wrong with homebrew, but following the

Yeah, its much easier just to use plastic and buy a radio-in-a-box.

>the public officials here are most impressed by the legion of VHF

Public officials here look at hams as (rightfully so) a bunch of
shack-on-a-belt police-authority-wannabes.

>The code test began losing all meaning back
>then as copies of official tests became available as "practice tapes."

Wow. You could make millions selling them.

>Then, the early volunteer examination program was riddled with corruption.

If true back then, why would things be any different today?

>I know serveral "11-meter pirates" who co8uldn't honestly
>copy 5 wpm, yet hold Extra-Class tickets.

Yeah, and I know a lot of extra-class ticket holders who don't know how to build dipoles too.

>Guess what? These guys
>almost all went on to set up digipeaters, ATV nets, emergency phone
>patches,

Not hard to pick up the phone, wait for UPS, plug in the AC power cord,
antenna connector, and a ground wire (optional).

>Today, I listen to the legion of no-code techs, and hear competent
>operating practices, on-aur courtesy, and nothing that should make any

Can you send me a tape? I can't find any of this locally on the two
meter good-buddy boxes.

>I see, with the
>expansion of the hobby, Radio Shack getting re-involved with equipment
>and training, and more small specialty manufacturers opening their
>doors.

So, this explains why more and more amateur shops are closing their
doors permanently from the amateur business (AEA, Tucker, etc.) and
others are talking about slow sales and sagging profits from the
amateur market (Icom/Yaesu/Kenwood)?

I think both sides will agree that the present written tests are trivial
and do not prove that any of us know RF electronics. I have heard the
most stupid questions from extras over on r.r.a.a. Would you be willing
to allow substitution of a EE degree for the 13wpm Morse code test? If not,
do you believe Morse code skill is more important than a EE degree?

Mike, you know and I know that all the amateur radio written exams are trivial. The extra exam is easy, the tech even easier. The truth is that most EE's could pass all the written exams in their sleep. The only thing keeping these very desirable potential hams out of the hobby is the Morse code test. Where I work, most of the techs are EEs and are amazed that they are considered second class citizens by the pro-code crowd especially when those high-and-mighty pro-coders don't even know Ohm's law for complex loads.

Doesn't it seem a little unfair to you that CBers are allowed HF privileges without passing a Morse code test? That gives CBers more HF privileges than techs.

I said in my posting if what I was saying didn't describe you, then I was not talking about you. Wonder why you responded?

> To all who don't fall into that catagory, I'm not talking about you.

OK brain boy, then how are we "technically challenged"? When I got my Extra
I took a code test AND an electronics theory test that you yourself said
was harder than the tech test. So how was I "given something for nothing"?
I worked for it sport! I wasn't GIVEN anything! If you want to be in a
radio hobby that has no code requirement, they already have one. Its called
CB.

Hi Larry,

I think you would be N8JPK. And a tech, unless you have up-graded since
4-19-94. My guess is you have not. Is the code the reason? Is that why you
are so quick to defend the position of those who want to dumb the hobby
down to the lowest common denominator? Much like the liberals want to do
America? You can always be a CB operator you know. They don't require code.
Burden of proof is on the prosecution. You show me any good reason to drop
it, THEN I'll defend my position.

Graham,

At the risk of starting a flame fest I will point out a few of your
REALLY stupid assumptions. First you should really work on your reading
comprehension. Cecil has never asked for and change in test for HIS
benifit. Cecil like many others of us feel it is in the best interests
of amateur radio to end the code hazing.

Cecil has been a ham for over 40 years he doesn't really need a radio hobby that has no code requirement since he has been doing just fine right here. I'm not quite sure what you had in mind with the last lines of your tirade but if you are infering that Cecil needs some help to get into ham radio you better look again at a call book.

Some one, I can't quite remember who, coined the phrase, "CBers that beep" for folk like you. It sure does fit.

Jerry

A test or challenge that has no relevence to the goal sought=hazing and I do agree it is indeed a bunch of crap perhaps there are other points on which we agree.

Hasn't been dropped for the past several decades I doubt we have the
power to stop this debate. If you are asking for mercy no problem I
almost never originate posts on this subject, I only respond to
ignorant mean spirited posts, the solution is obvious.

CUL Jerry

Rather inflammatory and subject remarks concerning a post I find rather close to the target.
BTW, whats with non-descript mail address, hiding from something?

The Extra's I know, even though they are great people, would be the last persons I would go to seeking knowledge about RF theory. I presented to this newsgroup before a case where an Extra wired an 80' long wire to 75' of RG-58 to a Radio Shack 2 meter HT.

I believe even you have called CW a 'filter'. A filter for what? Letting 'memorization' and finger skill steer the Amateur Community? This is not Nintendo. I believe the technical testing should improve by testing knowledge of actual theory. There have been some really great communication break through that are even being utilized by your Hard Disk Controller that Amateur Radio Operators have no idea about. The only reason Morse Code exist on the airwaves is because at the time you could only reliably turn a spark generator Off or On. This is hardly a reason to perpetuate a requirement.

Many electronic professionals could, and probably would, be interested in Amateur Radio. Morse Code is a barrier to them because, unlike yester-year, and the retired community today, they do not have time to commit to such an arcane communication method. To this, I often question why I am even replying to these newsgroups, for my time is taxed as well.

It is strange to note the really talented Amateur's I know hold Advanced tickets, not Extra. Never did ask them why they stopped.

>When CW diminishs to be a popular HF mode, surpassed by other modes
>(such as up-and-coming digital modes) then it is entirely reasonable to
>replace the CW examination with an examination on another mode.

Well then I guess it should have been replaced by a SSB test series quite some time ago then - in view of the fact that SSB is at least twice as popular as CW. But since rules and laws are not written pursuant to the results of popularity contests, there must be another explanation for the persistance of the code exams.

I would suggest the real reasons are stubbornness and fear. Are we going to allow ourselves to be guided into the future by relying upon such ignoble traits? Have we so little self-esteem as a group, and so little faith in the integrity of the service that we can never rid ourselves of the vestigial residue of an earlier time? Our we so unimaginative that we cannot properly define a relavent set of operator qualifications?

I think the answer to both questions is certainly NOT! We need only put aside our emotional attachments to the past, and look toward the future in fullfilling the charter goals of the service. Hams are no longer required to use Morse code in order to communicate, and likewise need not be required to know it. And as long as it continues to be useful, hams will continue to use it as an optional mode. Let us allow the era of the telegraph operator to pass into history with quiet dignity, and not bring about the necessity to force him kicking and screaming disgracefully into retirement.

Pissing and moaning would not seem to be unique to those against the code test. Only difference is, one group pisses and moans about people, the other about unnecessary rules. Learning code, for most, requires no more effort and commitment than does mowing the lawn or cleaning the toilet on a regular basis. It is a remedial task which is superflous to the majority of activities in amateur radio.

I find it amazing that some still continue to insist that amateur radio must maintain some form of manual labor in it's testing requirements.

I quite prefer operating CW to cleaning the toilet, but making such a choice does not endear me to my spouse. :-)

But this is not a trial, thus such nostrums do not apply. What is being discussed is under what circumstances is the government empowered to insist that an individual must demonstrate ability in Morse code prior to being granted the authorization to operate on any of the amateur allocations below 30 MHz. Since Morse code knowledge no longer is used as a tool for the mitigation of interference, as evidenced by the lack to compulsory use by the government, the need for Morse code testing is no longer there. Now, that does not mean that there are those who think that Morse code should be mandatory because of other reasons, i.e. a method for imposing self-discipline, facilitates international communications, etc. Regrettably, these reasons that are often proferred by the pro-code testing advocates have nothing to do with the government's legitimate concerns for those who use the amateur service frequencies.

If K4XA is an original call, and if one considers the level of intellect
brought to the newsgroup by this individual thus far, it is sadly
apparent the "denominator" has been very low for quite a long time.

"Joe Mama" right back to ya, Graham.

Why is everyone still arguing about CW? I thought this debate since
last year was well over, apparently not.
We all know that CW will eventually go so there's not much point
whinging about keeping it.

>>Hiram Percy Maxim by a

>Typical anti-code "welfare state" rhetoric.

Yet the desire of the procoders is easily shown to
be the liberal affirmative action mindset to prop up
continued use and their own goal of keeping the percentage
of use for CW up.

>CW remains a requirement because the mode of operation is one of the
>most popular on HF, surpassed only by SSB, and we don't have a SSB test
>because the FCC assumes most people know how to push a button and speak
>into a microphone.

And once again it must be pointed out that the CW
test is NOT an operational test, it is merely a translation
test.  The CW test in no way is the equivalent of
```

true operation. There's nothing involved by requlation
that requires the CW test to be one half of a short
QSO. The fact that it usually is is a matter of choice
by the person that made the CW test tape. The CW
test could just as easily have been the lead story from
today's newspaper as long as it contained the full character
set for the appropriate test element.

>When CW diminishs to be a popular HF mode, surpassed by other modes
>(such as up-and-coming digital modes) then it is entirely reasonable to
>replace the CW examination with an examination on another mode.

But as MD oft mentions, we do have testing of other modes
on the theory test. Why does CW, which is used by less
than 1/2 of hams, still have it's very own separate pass/fail
test element?

>[blah blah blah, yada yada yada ...
> more hate-filled rhetoric from Gary deleted]

My my, hate filled rhetoric? Gary's posts are anything
but that.

>>The truth is that the ITU has already agreed to end the requirement for Morse
>>speed testing for every radio service except amateur (and that exception is
>>only because no WRC has addressed amateur rules in the last decade). No
>>compelling arguments could be made for its retention in any other service.

>Q: Why exactly has the ITU agreed to end the requirement for Morse for every
>   radio service?

>A: Because those services have adopted other modes of operation and have
>   by their actions eliminated morse.

So has amateur radio; even by the ARRL survey less than 1/2
of hams use CW yet the separate pass/fail CW test still
hangs on...unjustified by anything MD has written here.

>Q: How does this differ from the Amateur Service?

>A: The amateur service continues to use Morse heavily on HF.

Only by personal choice...individual choice. The amateur
service has never mandated any mode and, in fact, no amateur
emergency preparations even use CW at all today. That being
the case, the only use of CW is by personal choice for
one's OWN personal enjoyment. Such use is no justification
of forcing everyone on HF to learn CW.

>Q: So what?

>A: When morse use on HF declines, and other modes surpass it, then the
>   time will arrive to eliminate the examination.

Morse use HAS declined and...
SSB has surpassed it. Or do you now doubt the ARRL
survey?

Can you help??

I have a CES (Winter Park, FL.) 700L *Touch-Tone Microphone.

**Do you have the Color Code for this Mike??

The Mike now has a connector for a GE-MVS series radio.

I contacted the company but they want $25 for a photocopy of the manual! At present the mike has a 8-pin Molex connector for GE~MVS. I would like to convert the Mike it to work on a KENWOOD UHF Radio. The Kenwood has a connector that looks like a modular telephone connector (only more pins)... I plan to build a junction box.

I HAVE data for the Kenwood Mike Connector, but I need data for the CES Mike!... While I would like to convert to a official CES Mike Cable for Kenwood, the cost is another $25! Plus, CES advised that the Mike would require modifications.

Any help with this project will be greatly appreciated! Any help with the switch on the back of the Mike, "AUTO" / "MANUAL"?

Many thanks!
Tony

So, you're saying you'd like to have a Federal Inspector coming to your house and checking out the construction of your entire radio set-up and then granting you priviledges to you based on what he thinks you're capable of doing?

>
> >There's nothing wrong with homebrew, but following the

>
The hams we have here in the Fairbanks area are the type that Hossie
mentioned. We help in running several community activities as well as
international ones like the Yukon Sled Dog Race. We volunteer our time and
radios to make these events safe for the participants and to keep others
informed of what's going on. If it weren't for Ham Radio, no one would
have helped Anchorage, AK when the Easter Quake hit in '64. We are
respected here!

> >The code test began losing all meaning back

Again, they're taking advantage of the available technology AND helping to advance our hobby. One of our repeater repair technicians is a lowly No-Code Technician and he is one of the main ones responsible for keeping over 30 repeaters up and running.

Come to Fairbanks and have a listen. Very polite and very professional operators, always willing to help each other out. If it weren't for the poeple in the Arctic Amateur Radio Club, I would probably just carry a radio for emergencies and auto-patch but, I enjoy conversing with fellow members here.

> >I see, with the

I was in Atlanta a couple of weeks ago and when the salesperson behind the counter at HRO found that I was only a No-Code Tech, he didn't want anything to do with me. Maybe that's why they're closing their doors. Radio Shack is always willing and able to help us out up here in the frozen north.

Now, to code or not to code... I choose not to code because I can't spend $1000 bucks for a radio and $300 for an antenna but, if one were to become available as cheaply as my two 2mtr radios did, maybe my wife and I will consider upgrading. But, for now, 2 mtr is just fine.
I think the main thing we need to concentrate on is getting more people upgraded no matter what it takes so that we can say "Hey FCC, don't take that band away from us, we've got xxxxxxx number of people that are using it." At least that's the way I see it.

>contingent consistantly calls this "too complicated". Their ultimate
>goal is no-code, no-theory. The ultimate in uncomplicated licensing.

sigh I wish I knew why people believed this. I have yet to read or hear a single argument which suggests a theory exam is not needed for radio amateurs. Nobody believes that.

There is a very simple reason for eliminating the code requirement:

Testing is not required for any other operational mode.

Hams seem to fear that everyone in the universe will want to join their ranks unless they introduce large barriers to entry into the hobby. Catch a clue people, there are already no-license hi-tech digital hand-held radios, they are called cell phones. They are convenient, available, and relatively cheap for large numbers of people. There is already no-license hi-tech packet at data rates substantially higher than the vast majority of packet radio, its called "the Internet".

One can get side tracked into all the issues of why CW is a good mode:

1) equipment is relatively cheap and simple to design and build
2) there is a long standing tradition of CW
3) it gets through where SSB and AM can't.
4) it is fun!

which are certainly all true, but none of which are particularly compelling
to require MANDATORY operational testing. If I choose not to use Morse,
then so be it. I should not be forced to demonstrate a skill which I have
no interest in developing.

Mark

That is irrelevant. There should be operational testing of some sort for
full privileges in other modes.

>Hams seem to fear that everyone in the universe will want to join their

If you changed the word "everyone" to "technically unqualified", you'd
hit the nail on the head.

(Worldwide)	Downlink	145.55 FM

---

* Radio Sport-15 has battery chargeing problems therefore the transponder and beacon are silent when the satellite is in darkness.

* Radio Sport-16 currently has it's Mode A transponder turned off. The ground controlers seem to be experimenting with the various beacons, therefore it is difficult to predict which will be on.

* Please note Amsat Oscar-27 has a very sensitive receiver, I have routinely uplinked to it with a handheld on low power. On the other hand reception of the 70cm downlink signal is more difficult without a directional antenna most of the time. Therefore it is important to make sure that you can hear the satellite downlink before you transmit therefor avoiding interfering with others already on this one channel satellite repeater.

* Fuji-Oscar 20 can also be used in mode JD (D meaning Digital), at time of writing this satellite was reported to be in Analog mode until further notice.

* Fuji-Oscar 29 can also be used in mode JD (D meaning Digital), at time of writing this satellite was reported to be in Digital mode until April 4. Here is the latest schedule:

Apr.	1(Tue)	00:28z	JD 9600bps
	4(Fri)	01:14z	JA
	11(Fri)	10:16z	JD 1200bps
	18(Fri)	00:46z	JD 9600bps
	25(Fri)	01:24z	JA
May	2(Fri)	10:26z	JD 1200bps
	9(Fri)	00:57z	JD 9600bps
	16(Fri)	01:35z	JA
	23(Fri)	00:29z	JD 1200bps
	30(Fri)	01:07z	JD 9600bps

* STS-83 is scheduled to launch on April 3rd, 1997 at approximately 2:01 p.m. EST (1901 UTC). The launch window is 2 hours 30 minutes long. STS-83 will include a SAREX package.

CALL SIGNS:

James D. Halsell, Commander, KC5RNI
Janice E. Voss, Payload Commander, KC5BTK

Donald A. Thomas, Mission Specialist, KC5FVF

QSLs: Send reports and QSLs to ARRL EAD, STS-83 QSL, 225 Main Street, Newington, CT 06111-1494, USA. Include the following information in your QSL or report: STS-83, date, time in UTC, frequency and mode (FM, voice or packet). In addition, you must also include a SASE using a large, business-sized envelope if you wish to receive a card.

This FAQ is constantly being updated and re-released on a weekly basis on or about Monday. Any constructive suggestions are always welcome.

It certainly is a relevant question when there is no compelling need for
such testing... or does Deignan believe in testing for testing's sake?

So how does Morse code testing, or mode testing for that matter, make one
"technically qualified"? Since it doesn't, there is no need for mode
testing.

Try the Radio Shack AM/FM/CB diguise antenna. I've had two on different
vehicles and I think they are great. You should replace the cable that
came with it with some good coax. I ran mine into a spliter and one
lead goes to my car radio (where reception improved dramatically!) and
the other lead to my scanner.

Learning CW is a "large barrier"? Please!

The truth is that people don't want to learn CW because it takes a little time and effort and they don't want to have to do it. I know that is why I didn't want to! But it was the requirement, so I did it. Can I just pass on the college classes that I think are bullshit and that I'll never use and get my degree anyway? Naw.

I don't think it's so much a barrier they are trying to put up, or a "technically unqualified" element they are trying to keep out. CW takes a *little* effort and time to learn and I think people in this "instant gratification" period we live in want to talk on the radio NOW.

I think learning CW shows a minimum level of committment and perseverance that are good qualities for people in the hobby to have. This minimum level of commitment and perseverence I am referring to transcends all levels of hierarchy. Poor people, rich people, handicapped people, yes, ALL people can qualify.

I am not against "no-code"licensing nor do I look down at no-code hams, I just think I understand why learning morse code has been a requirement and I don't think it was a bad idea.

Take care everyone and 73.

Does anyone have any experience with a Seeker Multiband Mobile Antenna?

I'm thinking of getting one for my Radio Shack PRO-2046 scanner.

I'd like to. Unfortunately, I don't think we're going to see any
changes anytime soon. So, its better to stick with what we have
then make things more lax.

If you have no interest in developing amateur radio's most basic skill,
you have no interest in becomming a radio amateur.

:>Catch a clue people, there are already no-license hi-tech digital
:>hand-held radios, they are called cell phones. They are convenient,
:>available, and relatively cheap for large numbers of people.

That's right, there is a REASON it's called cellular telephone and not
amateur radio ... any moron can buy/lease a cellphone there is no reason
for any license/competency testing.

:>There is already no-license hi-tech packet at data rates substantially
:>higher than the vast majority of packet radio, its called "the Internet".

Correct again, Sherlock. It's the internet, primarily wireline based
and
NOT amateur radio. One need only look at much of the activity on "the
net" and know that it takes no talent, knowlege, or ability ... just a
checkbook to get on the net. Anyone believe that The Amateur Radio
Service should become just another checkbook hobby?

College is a choice you can change. You can go to
different schools to avoid some types of required classes.
In any case, this is a government licensing requirement,
not a private entity. Simply put, the government has
an obligation to ONLY have relavent test requirements.
You don't find questions on the theory test on
vacuum tubes anymore because times have changed.
That is the position morse should be in....dropped as
a requirement because it is absolutely of no importance
to contemporary communications on HF. Use it all
you want, but the government has no role to play in
fostering continued use of a mode which has only
entertainment/enjoyment value.

>I don't think it's so much a barrier they are trying to put up, or a
>"technically unqualified" element they are trying to keep out. CW takes

>gratification" period we live in want to talk on the radio NOW.

The role of government testing is NOT to establish a work
ethic, sense of commitment or any other subjective quality
in an amateur. The role of government testing must be limited
t testing for a minimum set of qualifications to allow a person
to operate in the amateur bands.

>I think learning CW shows a minimum level of committment and
>perseverance that are good qualities for people in the hobby to have.
>This minimum level of commitment and perseverence I am referring to
>transcends all levels of hierarchy. Poor people, rich people,

You don't think it was a bad idea, yet you admit you don't
understand why it is a requirement. Does that make any sense at all?

I'm using a Rad Shack unit which clips to the window glass in my door
and uses the flexible antenna outside (bnc mount)  works much better
than rubber duck in car, but less effective than actual mag mount
unit.  Good compromise - I live in high crime area - they'll take the
mag mount off your car while stopped at a light!

Even easier to fix.  Loose the code test ASAP

I think the Herman's notion that operations testing is an easy fix is much easier said than done. I would hope that he can respond to some of my concerns as follows:

It goes without saying that testing is undertaken to confirm that the individual has the necessary skill or knowledge of that subject. However, since the government's legitimate concern is the mititigation of interference is among the users of the radio frequency spectrum, Herman has failed to show that such testing would be of benefit to amateur operation in general. Since Morse code testing has utterly failed to do so, what justifies Herman's proposal to expand operational testing when Morse code has utterly failed produce the desired results?   (There is no doubt that skills testing is important in the priviledges that are granted by the government, Herman has failed to show that such testing will solve certain problems in the context of amateur radio certification.) I can only conclude that Herman is unable to justify Morse code testing; yet, attempts to legitimize its existance by calling for the testing of the use of all modes. Since operational testing is useless in one mode, there is little chance that operational testing in all modes would be any less irrelevant.

Be that as it may, I would foresee a number of hurdles that the candidate would have to overcome. For example, let us presume that the operational testing for radiotelephone operation would be to communicate in that mode. Certainly, it would be odd to test an individual capability in such a skill having never been exposed to the operation of a radio. It only follows that the individual will have to practise such skills; but, the is problematical because the individual is prohibited from operating an amateur station without a licence. Thus, each prospective amateur would have to have an "elmer" to coach the individual along while practising these skills on air. What sort of accomodations would Herman recommend for those individuals who are unable to find and "elmer" for whatever reason? For that matter, I would imagine the Herman would not qualify as an "elmer", considering his disdain for digital communications (surely digital communications would be designated as "popular" by Herman....)

Another notion that I find questionable in Herman's proposal is that operational testing is limited to only the "popular" mode. Would Herman be kind enough to inform us as to what criteria would determine which mode is "popular" and which is "unpopular"?   What justifies this distinction? Is that not, like Morse code testing is now, arbitrary in nature? Would it not make more sense to test one's capabilities on those modes which are most likely to cause interference rather than on the shallow notion of its popularity? From a technical point of view, such testing is more likely for the "unpopular" modes because those are the ones that most likely are used by the real experimenters. But this points out that the "popularity" of a mode, with respect to others is irrelevant to the issue to the government's legitimate interests in managing the radio frequency spectrum. For example, as Herman has said many times, CW is the second most popular mode on the HF spectrum. However, he has never explained how the knowledge of Morse code is relative to mitigating interfering with other radio frequency spectrum users. What is seemingly forgotten by Herman is that it is the spectral purity of the emission that is of importance whereas the encoding scheme is insignifcant in so far as the legitimate concerns of the government.

Another issue that Herman fails to address is the concern of ensuring that the testing is objective, and removing, to the greatest extent possible, the subjectivity of the tester. What has to be considered is that operational testing doesn't devolve to a "pro forma" exercise and no one would fail; yet, there should be a definite criteria to measure the candidates capabilities while at the same time, extracting the tester's personal bias. The former is more likely, whereas the latter is unattainable. But anyways, Herman avoids the core question - What is to be gained by operational testing? Since there is nothing gained with Morse code testing, in so far as the government is concerned, why must it be compounded by the addition of operational testing of other modes which also irrelevant to the government's concerns? The corollary to this question is if the concern is the bad behaviour of certain individuals on the bands, Morse code testing was ineffective, what make Herman believe that expanding such operational testing would be any more effective?

I would hope that Herman would be kind enough to address these concerns.

: As a general class amateur I have taken and passed the 13 wpm cw test.
: However, if my radio quit working on the cw bands I would never know it.
: Why was I required to pass a cw test knowing that I did not like it or
: would ever use it?
: I do not know the answer. I did it because I wanted the general class
: ticket.

VERY GOOD! You did it because: You wanted the ticket! That IS the reason that the code should NOT die. I have heard lots of people say that the code is no longer a *critical* part of amateur radio OPERATION, and hence it should no longer be required as a test element. The operation part may be correct, but a critical part of LICENSING it must continue to be. In all of the posts of people who seek to abolish CW testing, I have yet to hear a proposal for replacing it. WHAT?! REPLACE IT?! WE JUST WANT IT GONE!! Well, the trouble is that, without the code, there is simply no challenge to obtaining a ham ticket. None whatsoever. I'm sure that even the most hard-core CW-test-haters would agree: If everybody could get an Extra ticket on their first test date, the airwaves would be teaming with newbies, many of whom would lack the learned respect for their hobby. THIS IS NOT TO SAY that those who opt NOT to upgrade lack this respect, or are in some way "newbies" even after years of VHF-only operation. They simply DON'T WANT HF enough to have it. BAR NONE.

The "incentive licensing" scheme is ENTIRELY HELD UP by CW testing. Do we really want to hastily destroy this necessary foundation of Ham radio without considering some way to keep it going? I received my Technician No-Code license in March of '93, when I was 17 years old, and was "Temporary AE" by December of the same year. If CW testing had not existed, the only thing that would have prevented me from going from Tech to Extra in one month would have been the fact that there was only one ARRL testing session per month. I'm 21 years old now (as of January), and head up Washington State University's "Rho Epsilon Amateur Radio Fraternity." In the past year, I have helped ten members get their 5 WPM, and 2 get their 13. Nobody took more that one week to learn 5, and the two who got their 13 did so because they took my advice and tried 5 WPM on-the-air.

My point after all this: I think CW is great, and I enjoy using it on-the-air, too. There are many who don't enjoy CW, however, and this is OK. I don't believe, however, that the so-called No-Code movement had considered the impact that removing the code testing would have on incentive licensing. It would be devastating. In my own humble opinion, many of those who call themselves "No-Code" activists are simply along for the ride -- selfishly awaiting the day when they can rush to the local W5YI session, take 3 theory

elements, and walk out an Extra. You can all claim otherwise, but that's
what I'll believe until I see a valid attempt to replace the brace that CW
has built for incentinve licensing -- or does anybody care what happens to
our fine hobby?

I do. --... ...--

So what is wrong with CW? Gosh I hate when people start carping about
the code. It is a legitimate mode of communication even in the 21st
century. If you don't like CW, don't use that mode.

Having been a VE for some time. I believe that people motivated to
become hams can learn to copy 13 wpm enough to become a general class
ham. IT really is NOT all that hard!

Two options:
1 = Antenna Specialists trunk-lip mount, MONR52, $41.99 plus shipping
2 = Buy #1 and then go to a local radio shop (NOT Radio SHACK), one that
installs radios in cars, and buy an "L" bracket and cable assembly (bring
the antenna with you to show them what size hole/base you need). The
"L" bracket mounts in the gap along either the hood or trunk; police cars
usually have this type of antenna. The Antenna Specialists scanner
antenna will screw into an "L" bracket base.

I have 2 of these brackets on the front of my S-10 Blazer.

This is perhaps an overstatement. A challenge is not the essential
element as a qualifier for an amateur radio license. The requisite
knowlege is all that is tested for in any of the examinations. They
don't ask how hard it was for you. Furthermore, as has been pointed out
on numerous ocassions by Todd Little, if there was no challenge to
passing any of the written exams, you wouldn't have any Generals - they
would all have an Advanced.

>I'm sure that even the most hard-
>core CW-test-haters would agree: If everybody could get an Extra ticket on

>whom would lack the learned respect for their hobby.

If the problem your trying to solve (via Morse) is caused by "newbies" and
their lack of experience, there is quite a simple and much more
straightforward solution: require that they not be newbies! Put a "time
in grade" requirement into effect. The code did not prevent this newbie
from upgrading to Extra.

>In my own humble opinion, many of those who call
>themselves "No-Code" activists are simply along for the ride -- selfishly
>awaiting the day when they can rush to the local W5YI session, take 3 theory
>elements, and walk out an Extra.

And this despite any and all evidence to the contrary - like the license class of the "No-Code activists" you refer to. There are 5 written elements; 170 questions out of 1700 in the question pool. Privileges principally include operating a radio. I find courteous and lawful operating to be of the greatest importance. And I like the fact that we have a hobby where studying applied electronics allows you to acquire a license to build and operate transmitters. But the rigors of properly operating an amateur radio are no where near as demanding as one might gather from all the rhetoric presented here on the newgroup. However, it does take practice to do it well.

Still practicing,

Cummings keeps quoting this "mitigation" claim, but the real question is "Who says this is true"? I keep seeing people post this fallacy, but I've never seen any evidence to support it.

>Since Morse code testing has utterly failed to do so, what justifies Herman's
>proposal to expand operational testing when Morse code has utterly failed
>produce the desired results?

Cummings assertion that morse code testing has "failed" is an irrelevant opinion with no basis in fact. Under what criteria does Cummings judge the morse test to be a "failure"? Cummings uses abject criteria to claim something that he disagrees with as a "failure" because he himself doesn't like it.

In typical "lowest common denominator" fashion of the welfare-state mentality, Cummings then attempts to erect a strawman claiming that since morse code testing has "failed" (something never established) then by 'definition' "all" operational tests are invalid. The true reason for Cummings' claim is that any operational testing implementation would go against his "give away the licenses" beliefs. Cummings attempts to further justify this with a "chicken before the egg" argument, claiming nobody would be able to pass a test because they couldn't get experience to pass the test. Of course, Cummings naturally fails to acknowledge that popular proposals in mode-based testing calls for an "entry level" license with a wide-range of operating privleges with limited bandwidth and limited power, to allow people to get familiar with the modes they intend to operate.

Peter

I ran into the same dilemma when I decided to put a scanner in my car. The neighborhood had been hit with a rash of "Thefts from Auto" and it seemed that the thieves were targeting cars with antennas hanging out all over them. I wanted to mount the scanner in the car and also mount an antenna in such a way that it wouldn't be obvious. Here is what I did:

First of all, my car is a sedan - 96 Honda Civic Si Coupe. I had all three rear windows tinted and then went to Radio Shack and purchased a female BNC chassis mount connector. I drilled a hole in the rear deck, right beside the child seat anchor and mounted the BNC chassis connector there. I ran the coax thru the trunk and under the carpet to where I had concealed the scanner. This worked GREAT. I was able to use the antennas from my handheld scanner in my car. I didn't have to worry about someone bumping it when they rode in the backseat because the antenna is flexible. If I wanted a little more range, I attached the telescopic BNC antenna. The metal of the rear deck acts as a ground plane and the reception was good. This also keeps the antenna out of the elements and you don't have to worry about knocking it off when your sweeping two feet of snow off of your car.

Hope this helps.

Just thought I would say that I agree with you on much of your arguments. But don't be too hard on someone who has a mental block about the code. One of the most frustrating things I have done as a VE is try to give the test to the fiancee of a ham friend. She is disabled to the extent that she had, at that time, epilepsy. I knew she knew the answers but she just couldn't calm down enough to TEST.

So, some are luckier than others, and with the current system, no body should be left out completely!

So what you're advocating is a double standard. You're saying it's OK for a college to decide on it's own ciriculum, but not the government when it comes to granting a license.

>The role of government testing is NOT to establish a work
>ethic, sense of commitment or any other subjective quality

I think we're pretty much at that point right now with memorizing question pools and multiple choice code tests.

Why?

>In all of the posts of people who seek to abolish CW testing, I have yet to
>hear a proposal for replacing it.

Many of us have proposed that the written test be generated by computer to eliminate the option of learning just the answers to the questions in the question pool.

>   The "incentive licensing" scheme is ENTIRELY HELD UP by CW testing.
>Do we really want to hastily destroy this necessary foundation of Ham radio
>without considering some way to keep it going?

"Incentive licensing" is certainly NOT a "necessary foundation" of Ham Radio,
which survived very well without it for many years. In fact, it appears that
"Incentive licensing" mostly drove the slow-coders out of the hobby,
as our numbers started to decline when it was put into effect -- a decline
that only stopped with the advent of the code-free Technician license.

Correct. Private actions are on no way the equivalent
of government rules. You don't like the requirements
at College A, then you have hundreds of other
choices. You don't agree with license requirements,
you have no alternatives.

That's why license requiremnts MUST always be
relavent and serve a compelling need.

>>The role of government testing is NOT to establish a work

I think there much oom for improvement
there. Formula questions should have an infinete set
of vales that can be used on any test. That'd be a
simple start to avoid memorization on abou 10-20%
of any set of test questions.

Perhaps Deignan should go and read the enabling legislation of his country. As I recall, it empowers the FCC to allocate spectrum and make determinations as to harmful interference and assess penalties as required. Does Deignan have any proof that the enabling legislation states otherwise? For that matter, what is the role of amateur certification? Correct me if I am wrong, but the bottom line is to ensure that amateurs don't cause interference.

> doesn't like it.
>

Whether I like Morse code has nothing to do with the efficacy of Morse code testing in order to permit individuals to operate below 30 MHz. In that Morse code is useless to mitigate interference is not opinion, but fact. Is Deignan able to show that the health of the radio frequency spectrum is worse in those bands where there are no-coded amateurs? I think not; indeed, most of the miscreants that are assessed penalties are to amateurs that have passed the Morse code for their misbehaviour on the HF frequencies.

I would be more than pleased if Deignan would be good enough to refrain from telling me what I like and dislike, I believe that I more capable of rendering such decisions.

> In typical "lowest common denominator" fashion of the welfare-state
> mentality, Cummings then attempts to erect a strawman claiming that
> since morse code testing has "failed" (something never established)
> then by 'definition' "all" operational tests are invalid.

The only straw man that is in evidence now is Deignan's attempt to link my objections to operational testing with the welfare-state mentality, whatever that means. Do I believe in a welfare-state, I most certainly do, so that my fellow human beings can be helped along with the eventual goal of being able to become productive members of society. Does that thinking extend to amateur radio? Hardly, because we are discussing a priviledge which is irrelevant to an individual's existence.

Deignan seems to be unable to read the subtle message that I posted. Let me be blunt, operational testing is of no value in amateur radio for the following reasons:

1. Impossible to achieve a level test criteria. This means that the variability of achieving a consistent, evenly applied test across the nation would be impossible. The ease or difficultly would likely be proportional to the whim of the examiner, and unevenly applied across the nation.

2. Operational testing is "pro forma". Such testing will result in very few failures. Although this would seem to be counter-intuitive to the first point, candidates would quickly learn which examiner is most likely to pass them, and go to them for that phase of the examination. Since every examination would result in success, it hardly seems worth the effort to have such an examination. (The problem is that it is easier to pass an individual on just such an examination rather than to justify the failure because there is little documentation to support the failure.)

3. Operational testing has no value in the context of amateur radio. Amateur radio is not a safety service - we do not, as a rule, communicate with other entities within internationally rules, i.e. as for what is stipulated in the martime mobile service. We have developed conventions among ourselves, but the fact of the matter is, that is only to satisfy our own needs. If someone is ignorant of our procedures, we should have the generosity of spirit to guide them, otherwise they will become frustrated and abandon amateur radio. But to up the ante by adding an operational test? In as much as Deignan is quite capable of being disparaging, let him answer the following - what is the need for operational testing? What problem would it solve? For that matter, he has never stated why Morse code testing should be continued (other than to state it must stay, by fiat)?

4. Operational testing would require a substantial effort of already licensing amateurs to assist in the education of those who wish to be amateurs. I believe that such assistance would be a noble endeavour, but practically, there are very few that would do so. Besides, as I have stated before, there are those who call for such testing that by their own admission would not qualify to assist in providing the opportunities to get practical experience operating a station because of their own narrow interests. As I stated before, even Herman would not qualify because I understand that he has no radiotelephone or digital equipment at all; indeed, he has disdained the use of these modes. He is entitle to pursue these interests as his wishes, but it is quite disengenuous to make a proposal in which he is unable to walk the talk.

5. Operational testing is oxymoronic. For example, Morse code is still used for EME, satellite and weak signal operations in the VHF bands. Yet it is not required to know Morse code in those bands. It defeats the purpose to bring back a mode test for which there ample evidence that it is no value (in refute to Deignan's above mentioned contradictory notion); otherwise, that requirement would have remained. For the other modes, what sort of examination would Deignan design for the operational test?

I think that is enough for today. If Deignan thinks that operational testing is of value, then I whole heartedly invite him to make the proposal to the FCC, otherwise he is only arguing for arguements sake.

The true
> reason for Cummings' claim is that any operational testing implementation
> would go against his "give away the licenses" beliefs.

I don't have those beliefs, so how could they run counter to them? But then again, Deignan also believes that Gary Coffman has said the same ilk. I shall let others decide on their own as to whether Deignan is capable of determining of what I do or do not believe.

> Cummings
> attempts to further justify this with a "chicken before the egg"
> argument, claiming nobody would be able to pass a test because they
> couldn't get experience to pass the test.

No, Deignan is incorrect, I make the case that it is egg, then the chicken, not the other way around. The only way that the individual can get the experience and practise the requisite skills is under supervision of a licensed amateur, unless we agree that the individual should be allowed on the air without any licence at all, an oxymoronic situation to say the least; allowing someone to get practical experience on the air without a licence. In any case, that can be problematic for those who are unable to find an elmer due to whatever reason, i.e. the local amateurs are a bunch of lazy louts, there are none locally. As a result, this individual who had not the opportunity to have the operational experience beforehand is at a severe handicap in passing an operational examination through no fault of his/her own. In as much I think it is a good idea to coach an individual along, but to test for it when it is of little value? What problem is Deignan hoping to solve with the introduction of operational testing?

> Of course, Cummings naturally
> fails to acknowledge that popular proposals in mode-based testing calls
> for an "entry level" license with a wide-range of operating privleges
> with limited bandwidth and limited power, to allow people to get
> familiar with the modes they intend to operate.
>

Popular? That's a stretch. The only reason why they are popular is that the pro-code testing crowd has realized the inutility of Morse code testing for amateur certification. As a result, in the hopes of retaining Morse code testing, they believe that all-mode testing is now required. What Deignan fails to discuss is the efficacy of any-mode testing in amateur radio. Again, if he thinks it is so valuable, then let him work on it and propose it to the FCC; otherwise, he is full of his own rhetoric.

Your comments on the subject of retaining the Morse Code requirement
remind me of ancient Witch Doctors, who believed that chanting the same
thing over and over again, without reason or logic, made the saying
true. Why does it need to be a critical part of licensing? What good
does that do?

>without the code, there is simply no challenge to
> obtaining a ham ticket. None whatsoever.

Golly, I guess you are such a brainiac that you could pass a theory and
regulations test with zero effort. None whatsoever. Pretty cool. I
couldn't do that. I had to study.

>I'm sure that even the most hard-
> core CW-test-haters would agree: If everybody could get an Extra >ticket on
> their first test date, the airwaves would be teaming with newbies

Well, thank God. At least we don't have to worry about that. The HF

bands very definitely are not full of newbies. There are very few new
hams. Somehow you seem to think that this is a good thing.

Incredible.

>I'm 21 years old now (as of January), and head up Washington State
> University's "Rho Epsilon Amateur Radio Fraternity."

I wondered how it was you knew everything. Now I know. :)

>My point after all this: I think CW is great, and I enjoy using it

How do you know? For that matter, what is wrong with killing much of
incentive licensing? I was a ham before incentive licensing existed,
and the hobby was more active and vital by a factor of ten than it is
now. It was teaming with new hams, of all ages, and was truly a
pleasure. Nowadays our hobby is largely an old man's hobby.
How many times do you hear "age hr is 79, been retired for 22 yrs."

> In my own humble opinion, many of those who call
> themselves "No-Code" activists are simply along for the ride -- >selfishly

Well thank you, I think I will claim otherwise, seeing as how I am
already an Extra, as are many or most of those of us who are agitating
in favor of eliminating Morse Code testing.

>but that's
> what I'll believe until I see a valid attempt to replace the brace that CW
> has built for incentinve licensing -- or does anybody care what happens to
> our fine hobby?
>
> I do.

I do too. And I've been a member of our hobby for 30 years, and watched
it go downhill, largely due to incentive licensing. Most of us who
remember the way the hobby was before incentive licensing recognize that
incentive licensing was a disaster to our hobby.
It has never been the same since.

: Learning CW is a "large barrier"? Please!
: The truth is that people don't want to learn CW because it takes a
: little time and effort and they don't want to have to do it. I know that
<snip>
: "technically unqualified" element they are trying to keep out. CW takes
: a *little* effort and time to learn and I think people in this "instant
: gratification" period we live in want to talk on the radio NOW.
: I think learning CW shows a minimum level of committment and
: perseverance that are good qualities for people in the hobby to have.
: I am not against "no-code"licensing nor do I look down at no-code hams,
: I just think I understand why learning morse code has been a requirement
: and I don't think it was a bad idea.

: Greg WG8N

Bravo!!!!! At least there's somebody else in here who looks at the big picture. The reason for CW testing IS NOT SIMPLY BECAUSE THE FCC OR ANYBODY ELSE THINKS CW IS COOL. IT IS BECAUSE CW DEMONSTRATES A LEVEL OF COMMITMENT TO ONE'S HOBBY THAT THE WRITTEN ELEMENTS CAN NOT! Why it this so difficult to understand?!?!?!? CW IS NOT A BIG DEAL!!!! If all you do is sit around all day whining about hating CW, you are, in my mind, not worthy of a callsign. If somebody can find a way to similarly test one's effort and commitment to their licensing goals, JUST SAY IT! It doesn't take two brain cells to figure out that you can't just throw CW testing away without REPLACING IT WITH SOMETHING ELSE. When I joined the hobby in '93, I didn't like the idea of CW, but I soon learned to respect it. When I committed to upgrading my Tech No-Code license, I committed myself to learning CW. It is a well-establish tradition (and no, tradition does not have anything to do with the future), and has great roots in our hobby. If all you do is worry about, then sure... it'll be hell. But once you pass it by, you'll see that the effort was worth it. This series of stages in developing your license is healthy.

BTW: I've never met anybody who couldn't learn 5 WPM in a week!

73's,
Aaron -Ki7QM (email reply to: jah@wsu.edu)

My sentiments exactly, Aaron, although I do question the "5 WPM in a
week" part. I'm not sure how long it took me to learn 5 WPM, but I
believe it was more like two-three weeks.

Best regards,
Lindsay

I took my code and passed. Ham radio is a hobby. You show your
commitment to the hobby by passing the code. Besides, I set hour after
hour studying to pass my code and I think everyone else should as
well. If you do away with code then bands will be filled with trash
like CB.

I said that!

If one doesn't agree with the license requirements, then one *does* have an
alternative. It's called CB radio.

Study what? The question pool? Anyone with a C average in school can pass
any of the written elements with less than a day's study if they have
the pool questions/answers, which are widely distributed on the net and
in books. I'm not advocating that people do it, just that the poster is
correct in saying there is no challenge in that.

Hello Aaron or Angela whoever is actually posting this.

My name is Jerry KK5YY pleased to meet you. BTW now you can no longer make the statement above truthfully. There are some people for whom code only comes with great effort and struggle. Some of us in this group get really tired of hearing how easy it is to learn code.

Jerry

Deigman might try reading the Communications Act of 1934, which sets forth
the purposes and objectives of govrnment regulation of spectrum access.

>In typical "lowest common denominator" fashion of the welfare-state
>mentality, Cummings then attempts to erect a strawman claiming that

It is interesting to note that it is only those appealing to the government
to maintain a life support subsidy for Morse (welfare statism at its lowest)
who raise the spectre of "welfare state mentality". Perhaps that comes from
looking in the mirror. A truly viable operating method needs no such subsidy.
But the welfare statists are obviously fearful that Morse cannot withstand
free market competition from other methodologies without coercive government
measures.

Bill, I think you misread Greg's statement. He states above that he DOES understand why learning morse code has been a requirement.

I, too, understand: It's relevent, it's effective, and it's a way to keep the HF frequencies from becoming severely congested.

For any given license, the requirements for HF access are the same for everyone. Admittedly, some individuals will expend more time and energy than others to master the code, just as some folks will spend more time on the theory than others. However, nobody is being denied access because of some egregious bias.

Best regards,
Lindsay

>like CB.

Keith:
You echo the same empty logic that has gone on before.
Read Part 97 and come back and tell us where Ham Radio
is defined by the FCC as a hobby.

You then end with the same tripe that others
before you have said (although at least you said it in a
clear statement).. i.e. I did it, now so should everyone
else. Sorry to inform you, but that is not how national or
international license requirments should be established
or maintained. If a requirement has no compelling and
rational reson to exist, then it should go...irrespetive
of how many had to pass that requirement before.

Lastly, you claim that without code the bands will
be like CB, yet with over 100,000 co-code hams
we have nothing CB like on the VHF bands at all.
Neither you nor anyone else can predict what the
impact might be if code is dropped. Fear of the unknown
is understandable but the comparison to CB is so
far off the mark it bears comarison.

CB - No license, buy a $40 radio and go on the air.

HF Hams (assuming there was no code test)
License still required. Theory and regs testing at
the general level would still be retained (indeed,
I and others have offered several ways the test
pool can and shoould be improved).
HF radios are not cheap...even older used ones.

Bill,

I don't know about you, but I got into Ham radio as a hobby. I was interested in electronics, but I was especially fascinated by the ability to communicate world-wide. Ham radio is, and always will be, a form of entertainment for me -- a hobby. Even though the FCC characterizes it as a service, I suspect that for most hams, it's a hobby, and that's the main reason they got a license.

Fine, what's your definition of a "popular" mode? Used by more than 50% of all amateurs? Used by 22% of all amateurs? Used by 2% of all amateurs? And what about the *unpopular* modes? Are you going to let people use modes for which they haven't been tested? And what about the modes currently being invented? Who writes those tests?

And how about the distortions in usage statistics which are purely an artifact of current regulations? Perhaps T1 rate digital would be the most popular mode on the lower end of 40m if it weren't prohibited by regulation, or more realistically, SSB might be the most popular mode on the lower end of 40m if it weren't prohibited there.

Where do you draw the line? And how do you even determine usage statistics uncorrupted by regulatory artifact?

Gary

True. :-)

>Now the other side...
>
>With the latest digital techniques, what are we up to, about 20kbaud?

The current amateur SOTA is 100 Mb. The amateur SOTA 5 years ago was 1.2 Mb. The amateur SOTA of 10 years ago was 56 kb. The amateur SOTA of 20 years ago was 1200 baud. Unfortunately too many amateurs remain stuck at the SOTA of 20 years ago in packet. But at least that's better than being stuck at less than 20 baud like the Morse users have been for nearly a century. Morse users have made no progress since the adoption of continous waves.

Note that we're stuck at 300 baud on HF, but that's because of regulations, not because of engineering feasibility.

>And what do you guys discuss that necessitates this high speed
>throughput? Nothing. Sorry, not quite true, there's how big the antenna
>is, what the power amp rating is, and what far off station was just
>contacted. Only difference is you run out of things to talk about much
>faster...

Actually, we exchange video (still and motion), text and binary files, do digital voice, send schematics and board layouts, browse the web, etc. It is amazing how much more genuinely useful radio becomes with a little bit more throughput.

>As soon as the satallite phone system is in place, you digital guys will
>sell your ham equipment, right? I mean, you want the very latest in
>maximum data throughput. No one wants to settle for that "old
>technology", right?

No, we won't sell our ham equipment. We have no control over commerical provider networks. We can't experiment with hardware or protocols on commercial provider networks. We certainly want fast, but we want it on *our* terms, not on those of some remote commercial provider.

>Give it a rest, it's a hobby. Each of you imply you're somehow better
>then the other. The joke is, people outside this hobby view each of you
>as the _same_; geeks!

It's more than a hobby. It is a chartered radio service with definite specified purposes and goals. By experimenting with modern digital systems we support those charter goals. We're self-training in contemporary communications technology, developing a pool of trained technicians and electronic communications experts to serve an augmentation role for the military and civil government in times of national emergency. We are advancing, to some extent, the SOTA in ad hoc networks and low cost digital hardware (amateur developed digital systems were used in Desert Storm). We support the logistical needs of emergency service agencies. And we even contribute a tiny bit, due to regulatory limits, to international goodwill by handling message traffic for foreign operators.

And of course we have fun doing much of this, and have a sense of satisfaction for doing other parts of this. We receive no other pay. We could do much more, of course, but we face the same "I've got mine" mentality by entrenched interests that others attempting to use modern techniques face (and have faced down through the years). But just as SSB supplanted AM, we expect to eventually dominate text transmission in amateur radio (we already move more text in an hour than the world's Morse operators do in a week), and ultimately video and voice transmission as well, if amateur radio isn't killed first by the Luddites.

Gary

Oops, read that too quickly.

>I, too, understand: It's relevent,

Why is it any more relavent than any other mode?
Test for it on the same basis as any other mode (i.e. merge
the scoring with an overall test score rather than as a
separate pass/fail element and you can make a reasonable
comparison then).

> it's effective,

No more so than many other modes. Ditto the comments
above again.

>and it's a way to
>keep the HF frequencies from becoming severely congested.

In other words it is purly an excersize to minimize numbers.
If that is a needed aspect of ham radio then someone should
determine the maximum that should be allowed and stop
issuing new licenses at that point until others expire.

>For any given license, the requirements for HF access are the same for
>everyone. Admittedly, some individuals will expend more time and energy

The bias is simply because the code has no reason to be
required anymore. No different than eliminating test questions
that pertained to vacuum tubes in the past.
Once again, the only thing a government test should
include is the things that are reuired on a sound and
rational basis.

Well, no, it's not. Constant repetition of these canards don't make
them any more true, either.

Even if they were true, they'd be pretty weak arguments for much of
anything.

06/04/1997

Crazy DX group & Web !!

This message is for announcing that, starting from March 26th 1997, the new "Crazy DX Group" Internet site, completely updated, is available.

Besides the very new graphic covering, the site is now completely available in English language, too.

You will find it at the WEB address: http://mline.peoples.it/crazy

More exactly, you will find:

- Detailed informations about the Crazy DX Group (who are the Crazy's, group's rules, membership list, etc...).

- Pages full-dedicated to the IIA award, (last informations about the activities, informations by the IIA committee, updated list of every island valid for the IIA award, IIA Award rules - HF & VHF, etc...).

- Software page, where you'll find: OFFICIAL I.I.A. SOFTWARE by IK0QOB last release 2.1 (freeware) updated at 23/03/97, several databases for Packet-Cluster(tm) (IIA, IOSA, SPIA) available both in italian and english language, etc...).

- Photo & QSL (very large photo-list of IIA activities, Crazy DX Group members QSL, etc...).

- List of many HAM-sites links.

All this, and other, is available at the following WEB address:

http://mline.peoples.it/crazy

Any kind of remarks and suggestions are mostly welcome and appreciated.
Just send them to the following e-mail address:

i05105@amsat.org

73's de Crazy DX Group....the Crazy Islanders !

=============== IN ITALIANO =======================

Crazy DX group & Web !!

Il seguente messaggio per Comunicarvi che dal 26 Marzo 1997 e' disponibile il
nuovo sito Internet aggiornatissimo del Crazy DX Group.

Oltre alla nuovissima veste grafica, il sito e' ora disponibile in
ITALIANO & INGLESE .

Lo potrete trovare all'indirizzo WEB : http://mline.peoples.it/crazy

Sul sito troverete:

- Informazioni dettagliate sul Crazy DX Group (chi siamo, statuto del Crazy DX Group, elenco soci, ecc...).

- Pagine dedicate completamente al diploma IIA, (ultime info sulle attivazioni, comunicazioni dell'IIA Committee, lista aggiornata di tutte le isole valide per l'IIA, regolamento del diploma IIA - HF & VHF, ecc...)

- Sezione software, dove troverete:
  SOFTWARE UFFICIALE I.I.A. by IK0QOB ultima versione 2.1
  aggiornata al 23/03/97, vari database per Packet-Cluster(tm) (IIA, IOSA,

SPIA) disponibili in versione italiana e inglese, ecc...).

- Foto & QSL (vastissima raccolta di foto di attivazioni IIA, QSL dei soci del Crazy DX Group, ecc...).

- Elenco di link a vari siti HAM.

Tutto questo, e altro, potrete trovarlo al seguente indirizzo WEB:

http://www.mline.peoples.it/crazy

Sono graditi commenti, segnalazioni e critiche di ogni tipo, da inviare al seguente e-mail:

> is understandable but the comparison to CB is so
> far off the mark it bears comarison.

come visit my neck of the woods. the 2m no-coders are exactly like
they are on their CBs minus the language. 10-4 and destinated and
what's your 20 and so on. when asked to adjust their on air dialog
1 in 10 of the CBers will comply. the others will tell you that
propagation on 11m is better than this repeater s**t and never use
their priveleges again. Membership drives for the club always pick
up some CBers as well as new to radio types. the new to radio types
are always more open to the expected ham behavior.
>
> CB - No license, buy a $40 radio and go on the air.
>
never been around a CBer eh? again visit my area or a truck stop with
cb repair done on premises. $250-$350 radios and $300-$600 linears.
50ft towers and $250 beam antennae. half of the CBers shacks rival my
own and i have been pretty fortunate.

> HF Hams (assuming there was no code test)

> HF radios are not cheap...even older used ones.
>
in regards to what? 80m AM in my opinion is THE biggest draw for

the CB crowd. these tube type radios are available and cheaper than
what they use now. i do computer repair/building work for the local
electronic and CB repair shop. 3 guys that work there would be hams
right now if not for the code test. they are nice guys to be sure
but have admitted that they would not change their practice on the ham
bands. they have home built amplifiers using 4-1000, 3-3000 and even
3-10000 being driven by Johnsons, Apaches and other old rigs and
transmit
several kilowatts. they curse, play music whatever on 11m. these guys
could TEACH the theory but want to talk like CBers on the longer
traveling
ham bands. many, many CBers that come to get their rigs fixed or
tweaked
express the exact same sentiment. i'd get my ham license except for the
code. they have no interest in short range fm priveleges so why should
they start with a tech license they say. sounds like the no-code tech
is
not doing such a bad job of getting more hams really interested in HAM
radio
in without breaking open a flood gate for those not really interested in
HAM.

> Bill Sohl K2UNK
> ARRL Local Gov't Liaison, Mt. Olive Township, NJ

i can't speak for yours our any other area, but i DO know the people
that
live here. it's very likely that you live in a metro type city that
does
not have this type of community. in central missouri, this IS what you
will
find in every town up and down I-44. so without drastic changes in on
air responsibility, the hf bands would become a worse place than they
are now.

AMATEUR EXAMINATION PRACTICE SOFTWARE

I'm looking for a program called "AMATEUR EXAMINATION PRACTICE SOFTWARE" anything above version 4.1.

This is a program for taking the many of the different ham tests. The version that I have is rather old and looking for something more current. I have version 4.1, from 1994, and need something more up to date.

If someone has the recent version of "AMATEUR EXAMINATION PRACTICE SOFTWARE", can you PLEASE email it to me?

Thanks..

James

well, in most cases, the work you did in school consisted of studying a large amount of material only to cough up a few answers such as "who's buried in grant's tomb?". or what happened in 1066 or compute the circumference of a flower garden 3 feet from center to edge.

if the tests were so terribly easy, i should never see any failures at the radio exams. last time around i think we had 6 of 18 that qualified for a license. and we only had about 7 or 8 unlicensed people at the exam...

actually, i'd bet if i picked ten questions at random from the novice pool and took them to a large radio club made up of long licensed hams, i'd bet at best i'd only see an average of 5-7 questions right across the entire group. since the tests are entry exams, you'd think that those in the service the longest would have the easiest time..right?

That's a big part of the problem, Bill and I'm glad that you bring it up.

In point of fact, a huge portion of presently licensed hams only barely squeaked past the test on luck, short-term memorization, and a few good guesses and then told themselves "I've passed the test, I know all that's necessary to know" and then promptly fell asleep only to be wakened by the need to say "UR 599, PSE QSL" at some opportune time so they could get another postcard to plaster on their wall so they can lie to themselves about what great, SOTA communicators they are ... They've been in that state for years and have fallen so far behind in terms of the changes in technology that they don't even realize how far behind they are ... it's like they've fallen into a well that's so deep they can't see all the way to the surface ...

The point that you make is a serious problem for our service and I feel very strongly that it points to a rather critical need for retesting at renewal time. This is a change in the rules that I would strongly support because I think it is perhaps the ONLY way to overcome the laziness and stagnation that have become so prominent in our ranks. I know the slackards, yackers, gamers, cheapskates, and others will bitch, whine, moan, and generally pitch a fit over the idea of having to prove themselves qualified at each renewal, but too bad. (many other things that require licenses require periodic recertification)

The technology of communications (which we're supposed to be keeping up with ... even advancing) is moving so fast that it's absurd to claim one is qualified today because one passed a test on tube theory 30 years ago, then sat down to chase DX and never learned another thing ... I am absolutely certain that there are still many OTs who used to build their own rigs (when tubes were the thing) but stopped years ago because "those damned transistor thingies are too small and confusing ..." These folks USED to be qualified, but they didn't keep up with the progress of technology and now they're so far behind that they don't have a clue ...

Bear in mind that I'm NOT saying that EVERYONE who's been licensed
for more than a few years is like this, but the reality is that there is a
huge portion of the ham population that *IS* ...

That this can happen says that there's something fundamentally wrong
with our licensing and testing system ... there are other things wrong,
too, but retesting at renewal time would at least assure that people
remained reasonably competent by keeping up with the inevitable
changes in technology ...

No, it was created automatically ... technology is wonderful, 'aint it?

It's a cryptographically-secure message digest that proves that
I really wrote the message and allows the detection of any
alteration to the message ...

If you watch a few, you'll see that they're never the same ...
because they are dependent on both every bit of the message
content and on a time-varying cryptographic function ...

Pretty neat, huh? (Discourages the twits from altering my posts
with their "cute" little "quotes," etc. to make it look like I
said things I didn't say ...)

Absolute rubbish. We are self policing...that does not include
the power to set the regulations, only to enforce by self
monitoring and reporting to the FCC observed violations.

>> You then end with the same tripe that others

>like registering for the draft eh?

The last draft was in the 60s/early 70s. You can argue
if there was a need. As I recall, those that were
drafted or already in the military weren't the ones that
set the rules either.

All illegal too from your description. Additionally, how many
of those types are there and it seems interesting that you
tolerate such illegals as friends and acquantences.

>> HF Hams (assuming there was no code test)

As a former Marine Sergeant and a current police officer, I feel I have
had my fair share of dealings with the "government" and I can tell you
THEY DO NOTHING ON A SOUND AND RATIONAL BASIS!!!!

I had government tests in the military that I neither liked nor felt
were relevant to my job. Typing was one of them. I never had to type
once in my four year tour. You see, the government don't give a rat's
patootie what you or I think. They don't *have* to do squat if they
don't want to. That's the bottom line. You either do it or you don't
pass. Relevant test or not. They won't go changing everything around to

accomodate a few over-zealous rebels. Don't tell me it ain't the same,
either. ALL government is the same.

Like Nike says...just do it.

With all the energy and time people expend complaining about the code,
they could instead be a general or above if they applied that energy in
another direction.

Well, now I'm gonna wait for Bill Sohl to disect my post and tell me how
wrong I am...

Take care everyone!

73,

Greg Emerson WG8N

Even assuming your statement was 100% true, that doesn't support the continued testing of morse.

>I had government tests in the military that I neither liked nor felt

Great attitutde. You offer no rational reason at all to keep CW testing. You view the requirment as self justifying.

>Relevant test or not. They won't go changing everything around to
>accomodate a few over-zealous rebels. Don't tell me it ain't the same,
>either. ALL government is the same.

I guess as a member of government you know best. I also know that it can be changed, and eventually will be changed. I've already done it so your statement is directed at the wrong person. You assume that bbecause I'm working for change that it is to benefit mysel...sorry to inform you, but I don't need the code dropped myself.

>Like Nike says...just do it.

Ditto my prior comments above.

>With all the energy and time people expend complaining about the code,
>they could instead be a general or above if they applied that energy in

Don't be a baby! If you shop around a bit and if you knew anything about
HRO
you would know the following:

1. In most cases HRO will give you the same price as anyone else. Just tell
them
who has it for the lower price and they will come down to that price.

2. They charge shipping for any order under $100.00.

If you don't do your homework when you are ordering, than don't cry when
you don't have a clue what the final price is. All ypu had to do was ask
what
the total was. If you don't like the price, SEND THE ITEM BACK!!!

Rocco

Two JOBCOM radios by Ritron:

One (1) JBC-200, 2-watt, 2 1/2 channel handheld with swivel case, A/C charger, Weather crystal (may or may not work where you are), 1 channel (Red Dot) installed, one open. Privacy module installed. Slightly used as a demo/loaner. Excellent shape.   Alone: $230.00

One (1) JBC-15M, 1-watt, 1-channel handheld with swivel case, A/C charger, Red Dot installed. Privacy Module installed. Slightly used as a demo/loaner. Excellent shape. Alone: $175.00

Take all FOR: $325.00 FIRM. Both working.

Entire H.F. Station for sale:

Kenwood TS 680S HF with 6 meters.
-100 watts on all bands, 20 watts on 6 meters, all mode.
- Narrow CW filter
- SP 430 matching external speaker
- AEA model ET-1 HF antenna tuner
- 20 Amp power supply
- Orig. box, manual, and service manual.

$900.00 including shipping continental U.S.

Misc. Ham equipment:

AEA PK-88 packet controller.
- includes MFJ TNC/MIC switch for Kenwood/Alinco radios.
- Orig. box and manual
- Serial Cable/Audio Cable/Microphone Cable.

$75.00 including shipping continental U.S.

MFJ Model 1796 Vertical Antenna:
- Covers 2, 6, 10, 15, 20, and 40 meters.
- Pick up or delivery near Hartford, CT

$100.00

Will split up station if necessary. Please e-mail me if interested.

The only reason for selling is that I am attending grad school and
working full time and will not be using the gear for a number of years.

I have compiled an Informatory Radio WWW page consisting of several different links to other radio pages across the web. Check it out...you might even find your web page being referenced. If you don't, drop me an email, and I'd be more than happy to add it if it contributes to the well being of the hobby of Radio.

73 es gud dx! Happy Scanning!

Working on a baseband sub-processor for killer homebrew rig and need some help: I know of the following commonly used signalling formats - are there others? Especially looking for formats that are public or at least published somewhere. The following list contains lots of (R), TM, etc. - ownership as applicable where not noted:

Continuous Tone Coded Squelch System (CTCSS)
Digital Coded Squelch (DCS)
Single Frequency, Two-tone Sequential like
  Motorola Modified General Encoding Code Plan
  Motorola General Encoding Code Plan
  Motorola Code Type Assignment Method
  Metro-Page 10 and 100 Code Plan
  Motorola Sub-Audible Code Plan
  Modax / Moden / Alert Center Code Plan
  GE Code Plan
  Quick Call (Code Type Y)
  Decimal Digital (5/6) Paging
HF AIRINC SELCAL 2+2 Paging (aviation)
DTMF Code Squelch / ANI
DTMF Paging   (the nnn*mmm kind mostly amateurs use)
DTMF Messaging (the Kenwood kind; anybody know if it's on-line anywhere?)
ASCII ANI
Trunked - Motorola
Trunked - Logical Trunked Radio (LTR-E J Johnson)
Trunked - EDACS (GE)
Trunked - SmarTrunk
Single-frequency Inversion
Split-band Frequency Inversion
CODEC means, like Moto ASTRO, SecureNet, GE SecureGuard, etc.
AX.25 Packet (HF, VHF, 9600 baud)
RTTY (all modes, shifts, etc.)
CW (A1 and A2)
SSTV (all modes)
Digital Selective Calling (maritime)
Emergency Alert System (new) and EBS (old)
IMTS (is this still on the air anywhere?)
Station control tones like
  Non-Simulcast Key Command Function Tones
  Simulcast Key Command Function Tones
  Station Group Disable (Knock-down) Tones
The International Radiotelegraph Alarm (maritime)

The International Radiotelephone Alarm (maritime)
Class A/B EPIRB Sweep Alarm

Thanks!

Hi,
In the last year we made a design and a complete FPGA for a wireless data communication. As our time is very rare now, we cannot finish the modem for ourselves.

We are looking for interested people who would finish the produkt and test it. The success of the product would be shared afterwards.

Here are some more Informations:
The wireless modem consists of an analogue and digital part. The complete modulation is digitally done by a FPGA. Moreover the FPGA does a complete CRC-Check and has a programmable synthesizer.
The analogue part consists of a sender and receiver part. For the analogue part exists a complete design and moreover some experiences due to some tests.
The digital part consists of a communication part with the FPGA and another communication part via a RS232. For this job we thought about a microprocessor (e.g. PIC).

The FPGA is complete and simulated. You can find more information about the FPGA at the WWW-address:
http://dezi.wu-wien.ac.at/~dusty/projekte/lddt.html

The wireless modem is designed to work at CB-band or 40 mhz frequencies. Due to a smart 4-phase modulation we can reach data transfer-rates of up to 9600 baud at a 10khz bandwith and around 100kbaud at around 100khz. The FPGA could also handle transferrates of up to 1Mbit, but therefore the design would have to be altered. (analogue part)

A big advantage of this design is the secure connection due to CRC-checks and due to the possibility to buffer data. This leads to a minimal CPU-Usage of e.g. a PC connected to the wireless modem. Hence it is possible to connect dumb terminals or to use the modem for complex remote-controls.

The price for the electronic components are around 80 to 100 USD.

Here is my address for everyone who is interested:

FOR SALE:
Yaesu FT 840 in NEW Condition. I added optional FM unit and includes the optional mobile bracket. This is a current model, not a discontinued one.

The rig has 100 memories and dual vfo's. The price is reduced to $650(firm) plus shipping. I used the radio very little times. Great H.F. rig for a potential or General ticket holder. Easy to use! I got the rig in anticipation of upgrading to General, but haven't had the time. Lots of nice features. Dual VFO's.

Very nice clean rig, though...

Please send e-mail to: n1rpd@amsat.org or francer@usa1.com

Yes....poor Carl.....and after spending all that time and
effort......still misses the point.

If a person doesn't want to learn code, fine. Don't learn
it. But don't whine about it and use excuses like "the
state of radio today" or some such nonsense.

With all the tools available today to learn the code with,
it isn't that hard anyway.

Mike, you DON'T get it. We are not whining, we are making
the effort to eliminate code testing. The question is WHY
should anyone now be orced to learn morse code? That is
the issue. Morse code only has value an an entertainment
mode for personal use...and as such has no reason to be
a requirment.

There's no safety reason for morse, no technical reasons
at all. Morse is not used in any manner that suggests any
need for all HF licnesees o know morse.

Morse should be strictly an optional choice to learn and
use.

Hi Mike, what about my friend with a commercial radio license,
years of experience as a broadcast engineer, who spent hundreds
of hours over 20 years and never got to 13wpm? Some otherwise

normal people cannot learn 13wpm no matter how hard they try.

Oh, come on, Bill! I think prospective hams should demonstrate an
ability to make a coherer/decoherer, a sal ammonical wet rectifier, and
a rotary spark-ga transmitter. Do away with those silly solid-state
theory questions on the exams and test for important knowledge, like
Type 57 plate characteristics and self-rectification. Don't forget a
section on the pghlogiston theory of heat transfer.

We must keep the hobby pure!

If your friend was able to pass the 5 wpm, then a waver may be possible based upon a learning disability. I do not mean that as a derogatory statement against your friend or any others that have tried and tried to obtain the 13 wpm. It is a foreign language and to some, learning a foreign language is an impossibility.

How about a medical waiver? Did you tell him that over 95% of the US
amateur spectrum is available via a code-free license?

I wanted to become a commercial airline pilot but couldn't pass the
FAA eye exam, so I chose another career. Maybe your friend should also
realize his limitations (especially after 20 years) and try persuing
another field of interest.

I've been lurking here as I have only just started studying for a
license, and the code is obviously controversial, however I haven't
found a post yet explaining w-h-y it is a requirement. It seems
there must be more of a reason than just "because". The analogies
offered seem a bit odd also ie., bad eyesight kept me from flying
so if you can't learn the code find a different hobby. (huh?)
If it is only an arbitrary requirement then why not require
fluency in French and the ability to do 200 push-ups?

Signed, a no code sorry ass loser for now <vbg>

Why should he get a waiver? There is absolutely nothing wrong
with him! The wrongness is in the Morse code testing requirement.

Hi Tom, welcome to r.r.a.policy. If Morse code testing were eliminated, the hobby would be populated by RF electronic engineers and that would make all the electronically ignorant hams miserable. Morse code is their only claim to fame. If Morse code testing were eliminated, they would be the ones labeled "not real hams" and that feeling is eating them alive.

WHY do we have CW...it is an operating MODE just like rtty/ssb/or atv
WHY should we learn it if WE dont want to...it does not help our
technical skills..i have operated in the hf band for years as a mars
operator to ships at sea an fixed land stations/ i have operated 10
meters all over the world as a NOVICE then a tech now a tech plus
I NEITHER WANT nor care to use the cw however atv/ssb/eme/meotor scatter
and 1.2ghz comm interest me..NOT CW which just another mode..and thats
all it should be..I am curretn building a MARS STATION with FULL ecomm
capability for the NAVY including downlinking real time satelite
info..every 10 mins. instead of the standard 20-60 mins you find on the
internet for my location (PASCAGOULA MS)...

AGAIN CW is just another mode..lets see that its stays there and doesnt
impeade further progress..I WILL NEVER UPGRADE BECAUSE OF THIS it is not
needed to operate on the higher band and i will not be there i get
around just fine without it thank YOU

In case you didn't know, you don't have to learn CW to use those modes.
You only need to learn CW if you intend to get on HF. Since 3 of the 4
modes you mention are restricted to VHF and above, that really shouldn't
be a matter of contention for you.

: (davidf@acay.com.au)

Hi Mr. Fox,

You may go to Apliu Street in Sham Shui Po (Kowloon) to have
a look... there are few shops selling radio equipment.

Hope this info. useful for you!

It would be interesting to know how many processor chips you radio has in
it.
Did you build it or purchase it as an appliance? Can you maintain and
repair it?
Do you understand all the logic operating within the case?

That is why we are AMATEUR OPERATORS... using modern comm. equipment.

Not to belittle anyone, just stating the facts. (as I see them)

last I looked, it's not practical "at this time" to run high speeds on HF "because it takes too much bandwidth." Don't know my self, because I'm only just getting into VHF/UHF packet, and sticking to 9600 baud.

I would suspect that if you could find someone to work with, that 56K would not be unlawful on the UHF/SHF freqs, just difficult- afterall, the Bit error rate would add up due to multipathing unless you were working dish to dish LOS like the "big boys" do.

IIRC, even 45 "baud" Baudot communications is substantially faster than the best Morse work- and there are folks working 1200 on HF freqs at this time- what does this tell you about the Morse masters?

How about more on antennas and "engineering" as well as "good practices" in the written testing- or a practical test- set up a Field Day station and complete a voice contact...

I am a member of the ARRL, but seem to have missed getting one of the surveys- I guess that I will just have to write in- code is OK if there is nothing else, but pitifully slow for anything. I don't mind having to learn some for "Treaty" requirements, but would like to see it required for relicensure- eg fine, you want to save parts of the HF bands for our code work, you have to re qualify at your stated speed every time you renew your license.

In the mean time, change the FCC requirments to match those of the
WARC treaty currently in effect.

As I was doing one of those hour and a half drives down the road again, I got to thinking deeply about no code. At first I thought to myself, I had to go though it. So shutup and pay ones dues. Then a wave of thought hit me. This happens so little these days. Can amateur radio learn from the military. After all the military learned from us a few times in our history.

I came up with the thought what about "time in grade". Im due for promotion soon, I think thats why I was thinking about it. Someone would take a test. Not just any test but a REAL test. Leave the answers locked up until gradeing time type of test. Cover many of the same topics covered now, with some added topics such as packet radio.

The first test for a novice license would be 125 questions. 100 would be multiple guess, 25 would be draw the schematic symbols type of thing. Draw a simple RCL or full wave bridge. A score of 70% on the 25 question part would be required to pass. A score of 75% would be required to pass the multiple choice part. The novice license would be automaticlly upgraded to Tech after 24 months (2 years). The Tech license will expire 5 years after issue should one not be able to upgrade. If one can not upgrade, one will have to retest for a novice class license again. Failure to upgrade to general would "loop" a person in this process. The current band plan will remain in effect for each license.

The second test would be for general class. It would be 200 questions of a more complex nature. 150 questions will be multiple choice and 50 questions will be "fill in the blank". A score of 80% would be required to pass the multiple choice, a score of 85% would be required to pass the "fill in the blank". questions. The general class license would be upgraded automaticlly after 24 months (2 years) to advanced. The general/advanced license does not expire. Once advanced is awarded it will be good for life. Again, the current band plan will remain in effect.

The third test would be for extra class. Extra class will be the people that issue the tests. This test would be geared towrds the testing aspect and would be 50 multiple choice questions. A passing score will be 95%. Again, the current band plan will remain in effect.

- Study material for each test will be FCC issued. To obtain the materials a letter of request will be required.

- Study material for each test will fall under the standard government test compromise rules. In short, one is bound not to say what was in or on the test or study material.

- A CDROM will be issued to each testing group. This CDROM will have the question pool for each test. A program that will randomly select each question for each test will be used.

Just tossing some ideas around. More like passing time as I drove from eddies hole to L.A. for a taste of real life agian. I really like the time in grade license upgrade idea. That way everyone gets a shot at all of the bands in a very short time. Same as now, the faster one passes the tests the faster the upgrade. But, if someone is challenged in the brain department one can still have a shot at being a ham.

Well, who's going to communicate during a real disaster when the cell phone sites are blasted away by nature or man and the phone lines are down? Who's going to have the wherewithall to quickly rebuilt a communications network, put up new antennas, work from solar, generators or battery within a few hours...

I can't think of anyone else but hams. CB'ers perhaps locally for a few miles, maybe, but "REAL" communications....

None.

>Did you build it or purchase it as an appliance?

More than half my transmitters were built myself from scratch. A favorite pastime of mine is stripping old TV sets and using the components for home-built transmitters.*

>Can you maintain and repair it?

Since I built them from scratch I can certainly maintain and repair them.

>Do you understand all the logic operating within the case?

Most of them don't have a case - just an open chassis. Great conversation pieces! Heck, some are mounted on pieces of wood with copper tacks as solder joints. When I get on the air the other op can't tell if it's

one of your microprocessor-controlled rigs or a breadboard rig (except
the VFO does a little jump if you cough too hard on it).

>That is why we are AMATEUR OPERATORS... using modern comm. equipment.

Oh, I see (or as Jim would say, "O, I C"). I'll pit your modern comm
equipment against anything I've built. Bet they will sound the same
on the air.

>Not to belittle anyone, just stating the facts. (as I see them)

Okay.

>William Lee N5WRX   (general class and proud of it)

73,
Jeff KH2PZ

*Those not built from scratch consist of an HW-16 which I'm rebuilding
due to bad assembly by it's original builder, and a Galaxy GT-550 which
is easy to maintain and repair.

Oh how I agree! The pro-code geezers are trying to defend a 100+ year old communications medium under the guise of "skill". Big flipping deal! Knowing how to build a CW transmitter is like knowing how to build a steam engine: It does require skill and practice, and probably has some practical value, but how often is it really needed or desired in the real world?

I also deeply resent the sentiment that proponents of modern equipment and modes don't know anything. I'll bet I know more about this computer than the best CW operator knows about CW. And I can communicate millions of times faster and more efficiently to boot.

Yeesh! I think the "coders" realize it is the 90's, we just have to convince them it's the 1990's. I wonder how many of them ride a horse to work everyday because it requires more "skill" than passively sitting there with your hands on a wheel and pushing some pedals with your feet.
No biggie. Just my opinion.

73
Charlie

So you only build completely stupid equipment that depends
entirely on "operator skill" ... that's quaint, but it sure doesn't
do much for advancing any skills ... once you've learned how
to solder well and stuff parts on a board, there's not a hell of
a lot of "advanced" things to be done with simple a simple CW
transmitter.

> >Did you build it or purchase it as an appliance?
>

> built transmitters.*

Again, it appears that you only build simple transmitter strips ...
now that's fine, but without a receiver you're sort of wasting
your time, right?

As has been pointed out, receivers are generally more tricky
than simple CW transmitters ... however, just as it's no big leap
to go from an OOK Morse tx to an FSK tx and pick up at least
6 dB of improvement in the process, it's not a huge leap to go from
a receiver that's capable of receiving OOK Morse to one that's
capable of demodulating a bit stream from that FSK signal, either.

I find it very difficult to understand why you beepers maintain that
there's such a huge advantage in "maintaining the simplicity of CW"
when the simplicity is virtually nonexistant relative to much better
methods ... the only difference of any *real* significance is that
beepers insist on keeping a part of the signal processing in one's
head, instead of relegating such menial chores to a simple machine
that can do a much better job ...

> >Can you maintain and repair it?
>
> Since I built them from scratch I can certainly maintain and repair them.

In this respect, I have to "give the devil his due" and admit that you're
head
and shoulders above Mr. "Put it in a box and send it back to Yaesu" (Mike
D.)

So there's essentially no shielding and the oscillator is a tad microphonic.
As the "Church Lady" (of Saturday Night Live fame) would have said, "Well isn't *that* _special_."

I guess that's to be expected when one insists on such "low tech" methods (hint ... the poor connections that likely result from "copper tacks as solder joints" can be a significant source of non-linear distortion, and may cause interference problems ... beware)

It is a bit sad and discouraging, however, that you insist on proliferating such marginal techniques to newcomers who don't know any better when you tell them (and it appears that *you* sincerely believe your own falsehoods) that "this is great stuff!"

Why not let those who like CW keep it.
```

A CW class ticket would permit the operator to work CW in the CW parts of the bands.

A no code ticket would not permit use of the CW portion ot the bands.

This really seems fair to me, but then who am I?

Is it true that during disasters thr FCC is asked to permit voice operation in the CW portions of the bands?

> This really seems fair to me, but then who am I?

It would be an improvement on the current system, but the restriction itself seems unnecessary. If only CW operation is permitted in a subband, then you have to know Morse Code to operate there. The only purpose a test would serve would be to keep slow-coders from operating CW.

CW is a part of ham radio and should always be. I know it kept me from getting into the hobbie for most of my life because I didn't think I could learn code, but if the truth be known, I was probably like 99% of the people who are for no-code---lazy. Once I made up my mind to work at learning code it was surprisingly easier than I thought, but it did take determination to keep at it every night if for only a few minutes. Well, I started this quest in March of 1991 and by November I had my Extra ticket. If I can do it anyone can. It had an extra benifit, because when I decided to learn to fly I discovered that each airport has a three letter identifying beacon and it's in morse code; my instructor was impressed. KG7TV

I just happened to be passing by, and noticed this thread... Permit me (an old ex-ham) to share my one thought with you guys...

I happened upon a recent vintage ham a little while ago, who proudly showed me his hand held two meter transciever; punching all the neat little buttons... explaining about how he could punch up the repeater and dial up a sattelite, and all sorts of wonderful stuff I didn't really feel too interested in... He did this for me because I had told him that I had been a ham...

So, whatta 'ya think? he asked.

I told him that it all resembled a cell phone, was my reply.

Where's the magic, anymore? Where's the thrill of hassling with a drifting receiver and a cranky transmitter.... Where's the challenge of trying to sort out a weak cw signal from Portugal, beneath all the clutter of 50 other guys, all trying to butt in, or whatever else they're doing? Where's the pride in having your own fist, or being able to recognise a buddy's... without hearing his call sign???

No smell of hot phenolic and wax capacitors. or the trhill of late nights, illuminated by the dim purple glow of my old final amps, pulsing to the rythym of my unspoken words...

Nah, I couldn't get too interested in this new stuff... there's just not enough romance in it for me...

Thanks for listening, anyway...

K9WVQ, ret.

I hear where you are coming from, but, who is going to volunteer to
learn the mose code.
People don't, usually, appreciate the value behind learning the morse
code until they have used it for some time.
I haven't used the code since the mid 70's yet I praise the day I
started learning it. During the time I did use it, it served me very
well.

Very few, but that's not a reason to force everyone ...

> People don't, usually, appreciate the value behind learning the morse
> code until they have used it for some time.

Most of us who did invest large amounts of time and effort learning the code, still do not see any value ... even many who actually profess that they regularly use and enjoy Morse, feel that forcing it on everyone is a bad idea, given the state of ham radio and the technical situation relative to today's *real* world.

> I haven't used the code since the mid 70's yet I praise the day I
> started learning it.

So, by God, everybody has to learn it because *you* think it was a good thing for you?

Sounds much more like "I had to do it, so so do you!"

During the time I did use it, it served me very well.

During the time I used it, code never served me very well.
It was slow, inefficient, frustrating, and very limiting ... not something I wanted to continue to use.

Now I know that some pro-code zealot will come along and try to throw out a bunch of insults, saying that "I was too lazy to learn the code right" or something, but I don't carl ... that's all just a pile of crap. There is NO valid reason in today's world to force everyone to learn Morse in order to gain access to totally unrelated HF priveleges ... therefore it's nothing more than a hazing ritual and goverment licensing schemes should not be centered around the maintenance of the hazing rituals prescribed by the Archaic Retro Radio Luddites.

Ah, so now the truth starts to shine its ugly head.

Carl invested "large amounts of time and effort learning the code".

Yet, Carl is a 5WPM, coded tech.

Thus, we now know why Carl never upgraded. Code doesn't come
easily to him. It requires a great deal of effort for him to
learn.

So, rather than put the effort in, Carl has remained a coded
tech for 20+ years.

Now, he wants to eliminate the code so he can "upgrade". In
other words, its that typical welfare-state mentality. Carl
wants something for nothing.

Hello all,

I have large inventory of (NEW) TRW Type FRW -22 Flat wire wound 10 ohm
resistors @ 55watts.
These resistors are 3.5 inches long, 1 inch wide, 1/4 inch thick. They mount in
the horizontal position using
the pre assembled shaft thru the middle and standoffs that accept two #8 or #10

screws.
The resistor mounts 1/2 inch above the chassis.
These are Mil spec vitreous enameled units of very high quality.
Put them in series or parallel for many applications.

65 cents each, plus a small fee for shipping via US mail.

Let me know how many you need.

Allen

---

* Radio Sport-15 has battery chargeing problems therefore the transponder and beacon are silent when the satellite is in darkness.

* Radio Sport-16 currently has it's Mode A transponder turned off. The ground controlers seem to be experimenting with the various beacons, therefore it is difficult to predict which will be on, 29.408 seems to be on most passes.

* Please note Amsat Oscar-27 has a very sensitive receiver, I have routinely uplinked to it with a handheld on low power. On the other hand reception of the 70cm downlink signal is more difficult without a directional antenna most of the time. Therefore it is important to make sure that you can hear the satellite downlink before you transmit therefor avoiding interfering with others already on this one channel satellite repeater.

* Fuji-Oscar 20 can also be used in mode JD (D meaning Digital), at time of

writing this satellite was reported to be in Analog mode.

* Fuji-Oscar 29 can also be used in mode JD (D meaning Digital), at time of writing this satellite was reported to be in Analog mode until March 21.

* STS-83 is scheduled to launch on April 3rd, 1997 at approximately 2:01 p.m. EST (1901 UTC). The launch window is 2 hours 30 minutes long. STS-83 will include a SAREX package.

CALL SIGNS:

James D. Halsell, Commander, KC5RNI
Janice E. Voss, Payload Commander, KC5BTK
Donald A. Thomas, Mission Specialist, KC5FVF

QSLs: Send reports and QSLs to ARRL EAD, STS-83 QSL, 225 Main Street, Newington, CT 06111-1494, USA. Include the following information in your QSL or report: STS-83, date, time in UTC, frequency and mode (FM, voice or packet). In addition, you must also include a SASE using a large, business-sized envelope if you wish to receive a card.

This FAQ is constantly being updated and re-released on a weekly basis on or about Monday. Any constructive suggestions are always welcome.

that's not a good reason for a test requirement. CW was always part
of the marine radio or military radio or commercial radio at one time
or another and yet it's been supplanted by other systems.

after all, you used to have to call an operator to place a call. today
you dial direct. why not go back to the days of cord boards and "number,
please?"...after all it's part of the history of the telephone system.

Dear Allen, and all the other readers of this news group
I am not a regular subscriber to this news group. Rather I am a researcher who searches for obscure information from sources that are not official in order to find out what the reality of a situation is. Many times what is offered as information from sources that have a stake

in what is being expostulated is heavily slanted pro for their side con for the opposition. It is my function to discern what it real.
Just on the chance that you might know (and what leads me to believe that this might work is the fact that Sean mentioned an AR 3000a and you responded as if you knew what that was), what is a

Model GMRS-210+3
UHF Model Two-Way Radio?

I know this is meagre, but it's all I have except on the same page (that came on my FAX) that has the above model number are the following model numbers:

Model GMRS-10
UHF Two-Way Radio

Model GMRS21-A
UHF Two-Way Radio

There is also hand written line on the page that says Comtell Electronics.

What I am trying to find out is: Who makes these radios? Is it Comtell Electronics? What are a radios like this worth? Are they state of the art?

Any information would be appreciated.

--
Hang in there!
Regards and sincere best wishes
AllisonWonderland

Children please,

One side whines that CW is slow and inefficient. Going along with that mentality, people who use CW talk (slowly) about nothing except, what, how big their antenna is, what their power amp rating is, and what far off station they just talked to.

Now the other side...

With the latest digital techniques, what are we up to, about 20kbaud? And what do you guys discuss that necessitates this high speed throughput? Nothing. Sorry, not quite true, there's how big the antenna is, what the power amp rating is, and what far off station was just contacted. Only difference is you run out of things to talk about much faster...

As soon as the satallite phone system is in place, you digital guys will sell your ham equipment, right? I mean, you want the very latest in maximum data throughput. No one wants to settle for that "old technology", right?

Give it a rest, it's a hobby. Each of you imply you're somehow better then the other. The joke is, people outside this hobby view each of you as the _same_; geeks!

Feeling defensive? Thinking "I don't care what other people think?"

Really? Then let other people use CW or digital, or whatever they want.

Like a bunch of spoiled children,

WB6DSW

Maybe not in terms of all modes available to amateurs, no, it isn't.
However, in terms of the most popular modes that amateurs use (FM,
SSB, CW) it certainly is.

I like the idea of mode-based testing. You want CW, take a CW test.
You want SSB, take a SSB test. And so on. Unfortunately the no-code
contingent consistantly calls this "too complicated". Their ultimate
goal is no-code, no-theory. The ultimate in uncomplicated licensing.

I don't know that it is a question of better or not.  I'm usually
interested in busting "Morse Myth" (tm) that seem to be promoted here
on a regular basis.  Unfortunately due to tradition, outdated
training material, and a bias in the licensing system, amateurs
are led to believe that manual OOK Morse Code is the "be all, end all"
with respect to reliability, weak signal performance, simplicity,
etc.  That most of the that is either untrue or of little consequence,
matters not a whit to those trying to maintain the status quo.

That's all many of us are trying to promote.  If the Morse ops want
to use and require Morse proficiency, then let them have it in their
```

exclusive bands. On the other hand, let those that wish to use other modes also do likewise without bowing to the Morse God.

> Like a bunch of spoiled children,

Who's "spoiled"? Those that are "with" or those that are "without"?

As a general class amateur I have taken and passed the 13 wpm cw test.
However, if my radio quit working on the cw bands I would never know it.
Why was I required to pass a cw test knowing that I did not like it or would ever use it?
I do not know the answer. I did it because I wanted the general class ticket.
And if you think it was easy for me, think again.
I do not feel that I am any better than any other class operator because of it.
Radio is radio and I say welcome to all who enjoy it as a hobby.

If that sounds like spoiled whining then all I can say is .... whaaaa whaaaaa.
I got mine.....

William Lee   N5WRX ..... was KB8DWQ and WD5CQS

Michael,

Your comments here remind me of the accusation you leveled at me the other day. You seem the be pulling "facts" out of thin air. You speak to others' motivation and goals, sorry Michael, you can't know our minds. You make these rash statements despite the fact that the anti code test crowd has repeatedly and vigorisly denied what you claim is true.

Are we to believe you, and assume that all the folks who post here who do not believe that amateur radio is served by the code test, are liars.

I believe that the folks who would end the code test are honorable and you defame them with this broad brush accusation. An apology would be nice; and quite a surprise.

Jerry

Mike, that's an outright lie ... and you damned well know it!

We no-code-test advocates have VERY consistently voiced a belief that the written tests should be made more meaningful and relevant and the wrote memorization of answers to the theory parts should be eliminated (band limits and other rules things are simple memorization for everyone, but people shouldn't be able to get a license without truly understanding the technical parts)

In fact, it's been the pro-coders (you included, I believe, though I haven't checked the archives) who keep saying "eliminate the code, eliminate the theory, we're all appliance operators anyway ..."

I know you have some very slanted views on the code/no-code issue, and believe it or not I believe that you're entitled to hold those views even though think they're ridiculous and oppose them ... but please try to refrain from outright lies in your zeal to forward the pro-code position ...

"innocent
mistake" on MD's part ... I don't think he cares how far the truth is
violated
in the course of furthering his pro-code rantings ...

Many (most) don't qualify their stances because they believe themselves
to be correct under all conditions. I'd wager that 50% of all amateurs

believe it to be impossible to copy a signal that they can't detect
much less copy by ear.

> I like the idea of mode-based testing. You want CW, take a CW test.

I have heard few claim that it is "too complicated", although it would
make our licensing structure even more arcane than it already is. What
purpose would mode specific testing serve? Is an inept RTTY operator
going to cause any significant harm to anyone else? For that matter,
as I've asked before, what harm does someone with a lousy fist or
poor copying skills cause by utilizing OOK Morse Code?

I'm looking for an aerial for the scanner in my car. Rdaio Shack do a magnetic mount aerial, but I'd rather have one that I can mount on the side/hood of my car (frankly, I don't want to add another 3 feet to the hight of my car).

Anyway, I'd like to hear from anyone who can either tell me of an alternative aerial or can give mt the name and address/phone number/e-mail address of a company who make such aerials.

Thanks,

Peter

Try this:

Get a rigid plate of metal or tin. Drill a hole in the plate to mount your antenna.   Bend the plate so you can roll the window up from the bottom of the bend!

Coax feeds into the window to the left or right of the plate.
Important! DON'T crush the coax!

You may wish to hot glue two short lengths of coax jacket on the plate edge, at the bends to allow more area for the coax between the window and the window channel. Slice the jacket like a hot dog bun to fit.

```
                                           *

It has become evident that the ex-service now hobby is done:
Stick a fork in it!

It serves no one that cellular doesn't.
We are not unique, look around. Everyone has radios, phones.

Most operators are tunnel-visioned, goat-headed people. They think that the license, the code or the younger thinkers are the problem:

I contend it has been the ARRL, NTS and the volunteer exam/incentive licensing that has did it in. To many "elite" people who must complain when someone says what they want to say or operate as they want. I once thought packet radio might go somewhere but we never got over 1200 baud.

Now if the fact that cell phones were allowed in the Olympic venues but ham radios were not doesn't show you something, listen to a voice traffic net like the Indiana Traffic/DewDrop/Mushroom Cloud Spotting net some afternoon. NTS needs to tie up a radio frequency to handle fake messages for people who are too lazy to pick up the phone or mail a letter to mom wishing her happy birthday. Give me a break! They even pass phone numbers of recipients AND NOW even E-MAIL ADDRESSES!!!A JOKE! Right?

I am just waiting till all the VHF spectrum is gone, along with most of the HF spectrum. Then we will all be CBers, like many elite hams call others in order to degrade an opinion they can't stand to debate.

Structure, as per ARRL, has not kept up with the purpose of the "service"
That service used to be needed, now we are "bookmarks"for other wireless services. The latest band gone is 2300 MHz for wireless internet, not for packet, which should have pushed been years ago, along with:

902-928 GONE well "shared" by every device that would hear hams! Lesson?
220-222 GONE
144-148 soon to be gone
222-225 soon to be gone
430-450 soon to be gone

Do you get the picture?
Maybe I drew one for you...

I have listened to this situation for years. It has recently been posted that the Indiana Traffic Net on 3.910 is an interfering disturbance. I fully agree. Let me explain then consider if it makes sense to you.

The National Traffic System has evolved into an inefficient example of what this "hobby" has turned into, a tower of babble. For example, they crank up when the frequency is in use by others, claiming they can't hear the East Coast. Then, ask for checkins with traffic. After not getting any traffic or a few pointless messages, they call a roll call! This wastes another 5-10 minutes for no purpose. Mind you this is 4 times a day. Then the net control generates a message telling some other manager how many checkins, total time wasted and his blessings. There simply is no efficiency to this voice NTS trash! A typical NTS message contains the recipients' phone number and sometimes even e-mail address!

What is obvious to me is that this is a waste of an HF channel, it would be less of a disturbance on VHF of course but they claim VHF won't cover all the stations? With all the repeaters across any state? Ok, lets go to
packet. The claim is packet doesn't train voice handlers. HUH? If a voice
operator can't handle an emergency naturally, NTS fake messages won't give him a clue anyway! I question the circumvention of postal and telephone services in the name of training for "the big one". I also have heard the Indiana Traffic Net has started complaining that the government will no longer supply raingauges for another net they run, The Indiana Dew Drop/Mushroom Cloud Spotting/Warfront Net. There comes a time when you have to pay your own way. This is another waste of a HF channel when NexRad radar can show precipitation and we already pay for NOAA weather stations to provide the US public with such info. Why is there over 2 hours a day wasted with nothing accomplished. This net is just an example, not all NTS nets a slumps like this but most are on HF. There is no reason to interfere with such waste! It is sad what this service has become. All of this stuff can be handled on VHF or e-mail or let the lazy senders pick up the phone! It doesn't provide much of any training and besides ham radio offers very little

relief for emergencies when cell abound in public emergency services.

Yet the ARRL claims all this NTS public service and allocation claims.
Just one example of how NTS, the ARRL and its' mentality have ruined
our chances for survival as we are allocated NOW. You are suprised
that 144 and 440 are going to be "shared" by satellites? This is an
idiotic statement supported by the ARRL like they agreed to "share"
902-928. How many of you run any 900 operations? 222? 1296? 2304?
It will all be gone by about 2000, mark it down and use it now!

Maybe you should start another traffic net. It will act as a bookmark
for someone who wants to use that frequency for wireless internet at
56Kbps! Now that is progress, not this NTS crap on 3.910 and other HF.

I will gladly accept flames, replies via NTS only so be patient,
it may take a few weeks for an answer!

The ARRL and NTS - Clueless in Newington!
Woody

Let the ARRL handle this. They are unsurpassed at screwing
up a good thing like new technical frontiers and freedom.

> Add to that one of the nice side-effects of SS signals (your

Why? Part 15 devices need not worry about DFing or content.
The cart is before the horse.

> There were some of us at the FCC who actively fought approval of
> SS for amateur use because of the inability to perform those

Such a big threat. Rather do away with source: Hams

> CRS> Let's face it ... large parts of Part 97 technical rules are
> CRS> outdated, obstructionist, and absurd.

Agreed. The man is right. The ARRL has negotiated this for us.

```
     We won't need new rules when there will be no one to rule.

>  Your personal opinion.  Wear the moccasins for a while......

     Whatever that means. Smoke another one!

>  The amateur radio service - as well as any other service -
>  exists on the sufferance of the agency, not vice versa.

     Too bad we needed NTS and contesting instead of freedom to
     experiment. Lack of equipment is no excuse to hold
     back a "service". No wonder we are doomed as a "hobby"
     Just a set of bookmarks for wireless to "harvest" for $$$

>  73  de  Phil Kane - K2ASP (since 1952)

     45 years and still not living in France as a subject.

     Good luck. The service is gone. Renamed a "hobby" where
     people contest, not contribute. Ham radio service - R.I.P.!

Yep. But I really am hoping AMSAT will change this tide of problems. It has the capablity. Just hope the Rocket doesn't blow. If that happens THEN you can kiss Amateur Radio Good by except for the not needed "Maybe the propagations there now" HF band. Then we will all have to know code to become a member faternal Order of HF'ers. :-)

I think the drop/lackofinterest/badvibes are simply due to technology and the changes that have taken place in computing, digital, radio, etc. technology. Electronics has advanced to the point where it's both complex and difficult to implement as an individual hobbist. Electronic components even are difficult to use and apply without a thorough understanding of electronic theory (essentially a college degree) and parts are difficult to obtain in small quantities due to economics etc. The state of the art of radio is cellular and satellite broadcase which use complex computer technology and digital encoding. The current ham community is restricted in their ability to experiment in these areas by the complexity of the technology as well as the current regulations regarding such experimentation. If the regulations allowed it, I think we'd see more activity and interest in ham radio. There was a time that advanced in the technology came from the amateur community, but now advanced come from the corporations.
I'll stop there.....

GLOUCESTER AMATEUR RADIO & ELECTRONICS SOCIETY

GLOUCESTER ENGLAND

If you live in or around Gloucester and are interested in electronics, robotics, microprocessors, computers or amateur radio our society could be for you!

We meet every Monday evening at Churchdown School, Winston Road, Churchdown, Gloucester from 7-30 p.m. to 10-00 p.m. and offer a varied programme for the electronics hobbiest.

If you'd like to know more why not come to our Open Evening on Monday 10 March.

Other forthcoming events are:

7 April Construction Competition
5 May a presentation on NASA and space exploration
12 May a presentation on computers and communications
9 June a presentation on phase locked loops

Further details about the society can be found on our web pages at http://www.furcot.demon.co.uk/gares0.htm or by sending e-mail to gares@furcot.demon.co.uk

:
:Now if the fact that cell phones were allowed in the Olympic venues
:but ham radios were not doesn't show you something, listen to a voice
:traffic net like the Indiana Traffic/DewDrop/Mushroom Cloud Spotting net
:some afternoon. NTS needs to tie up a radio frequency to handle fake
:messages for people who are too lazy to pick up the phone or mail a
:letter to mom wishing her happy birthday. Give me a break! They even
:pass phone numbers of recipients AND NOW even E-MAIL ADDRESSES!!!A JOKE!
:Right?

Amateur radio is in danger of disapearing for lack of interest so it
is necessary to invent reasons to use the service. If it wasn't for
old men chatting and people inventing reasons to use their equipment
the bands would be mostly empty.

:I am just waiting till all the VHF spectrum is gone, along with most
:of the HF spectrum. Then we will all be CBers, like many elite hams
:call others in order to degrade an opinion they can't stand to debate.

There is no need for the large amount of spectrum space allocated to the
amateur service. 144 to 148 could be reduced to 144 to 145 with no harm
to amateurs. 430 to 450 could be reduced to 430 to 440 and stil allow
ATV. Most other bands could be eliminated or reduced by half without
harm to amateurs and with benefit to others.

:Structure, as per ARRL, has not kept up with the purpose of the
:"service"
:That service used to be needed, now we are "bookmarks"for other wireless
:services. The latest band gone is 2300 MHz for wireless internet, not
:for packet, which should have pushed been years ago, along with:
:
:902-928 GONE well "shared" by every device that would hear hams! Lesson?
:220-222 GONE
:144-148 soon to be gone
:222-225 soon to be gone
:430-450 soon to be gone

:
:Do you get the picture?
:Maybe I drew one for you...

Amateur radio is no longer needed but in fairness to those who can't give it up a few bands should be retained in reduced format.

If amateurs want respect they need to clean up their act.

Barry

If you want to know what service the amateur radio community provides that cellular doesn't, I invite you to come down and talk to the people who were involved in the recovery efforts after Hurricane Andrew. Most of the cell sites in the affected area were blown away and the ones that were left were overloaded. Hams provided a lot of the communications until other forms could be restored. You may think Ham Radio is on its death bed and gasping but as long as the are disasters of this magnitude and hams willing to help out, ham radio will be alive and well. We just sometimes have to remind the bureaucrats that see only dollar signs that there is more to life than money.

I once received an NTS message ... it was a birthday greeting from some QCWA brother I'd never met, who has sadly passed from the scene, and whose call I have long since forgotten. It was his device for teaching the "novices" how the NTS worked. The system "administrators" asked him to stop send his greetings ... because the number of messages he sent "clogged" their "system", making it impossible to move the "higher priority" traffic. And, we really do NEED such systems! ;-)

They could have flooded the area with jobcomms.
I am not saying it can't.
Most times lately, it don't.
There are not many hams left who can "rough it".
Look what "field day" has become...
Need I say more?

I'l be in HK for business next week and was wondering about picking up
some new gear -- Yaesu's FT-50R dual-band h/h is top of the list! :>

Has anyone here bought gear in HK? Are the prices that much cheaper
than at home (for me, home = Australia)? What shops can you recommend,
which should I avoid?

In short, are there any HK-savvy amateurs to help a first-timer from
getting burnt?

Thanks,

df

(ps. sorry for the cross-post but I wanted to make sure I got a good
spread of fellow amateurs who may have 'been there, done that').

Amateur radio should be retained for those that want it. But the bands could be reduced to one quarter of what they are now and still provide room for the hobby.

I spent a fortnight in HK last December.

I found a few shops selling amateur gear.  The prices were generally
higher than in the US.  Apparently most of the shops expect you to
dicker on the price and start out high, but the IC-2000H I looked
at listed at 400,000 HKD - about $520 US.  I said "that sells for
about 225,000 HKD in Los Angeles" and he couldn't even come close,
much less offer an attractive deal.

Mel,

I dont have one, but you might pass a note along to Jim Moore WU3V (jim@usl.edu) and see if he's heard of anything. Jim runs the Packet Cluster down in Abbeville, La. and there's usually messages like that floating along there. Tell him I sent ya, and maybe he'll pass along access to the Net side of his gateway and letcha read the messages on his cluster.

Good luck

After reading all this drivel by NK2U and countless others. Ham radio operators show to the world, they wish NOT to allow an outdated mode to die. They would rather be rigid to the point of breaking the hobby off instead of being dynamic or say flexible. How stupid!

I don't care if you want to operate CW. It should not be required any longer. International requirements are vanishing, so will this 'HOBBY' if this rigidness keeps up. This is my opinion.

I wish the ARRL had just left electronics theory in the test so most of you appliance operators would be in this hobby! Electronic theory was watered down when the ARRL started generating question pools.
I would love to see most, NOT all, you extras pass a technical test worth something more than outdated 20 wpm CW.

NK2U would have to join the Army, to learn electronic theory not CW!

Amateur Radio: one auction or so away from its demise...

Kill the code or kill the hobby?

If you're going to make a believable case, you have to at least get your facts straight.

In article <33195106.4079@kerrlake.com>, rafman@kerrlake.com says...
>
>It serves no one that cellular doesn't.
>We are not unique, look around. Everyone has radios, phones.

The gaping hole in this argument has already been displayed.

{deletia}

>
>Now if the fact that cell phones were allowed in the Olympic venues
>but ham radios were not doesn't show you something,

It doesn't, because ham radios WERE allowed in the Olympic venues. Your info is outdated.

Are you trying to help?

I admit I have not followed this thread all the way through, but I have to agree that the code has to go. I have quietly held this view for a long time, so I figure this is as good a time as any to speak up.

Morse code is the 90's equivalent of smoke signals. It's a quaint and interesting skill, but has no longer has any practical value. The fact that it has been abandoned by every other communications entity should tell you something.

We all lament that it's so hard to get young people interested in ham radio, but come on you old buzzards!!! CW IS BORING! How are you going to convince the average 10 year old, who will barely even wait for a 28,800 b.p.s. modem to do its thing, that tippy-tapping dots and dashes at 13 or even 20 w.p.m. is exciting? You're offering them a horse & buggy in a space shuttle world, so it should shock no one that they're not listening.

If we were genuinely interested in perpetuating this hobby, we would dump CW outright and shift focus towards computers, packet, ATV, and satellite communications. See a theme here, ladies & gentlemen?

For the record, I am a ham & got my ticket long before no-code, so I'm not playing sour grapes here.

No biggie. Just my opinion.

Charlie

The question pools are generated by the VEC Question Pool Committee, not
the ARRL. ARRL is a participant on that committee and I can tell you
with certainty, ARRL does not always get its way. :-)

>I would love to see most, NOT all, you extras pass a technical test

IMHO, things are not a lot differnt, defacto, than in the time when the
FCC conducted exams. Several study guides published the exact FCC
questions and correct answers (notably the infamous Dick Bash guides).
The technical questions of today are perhaps even a bit harder than those
in the "good old days," IMHPO.

>NK2U would have to join the Army, to learn electronic theory not CW!

I wrote an article that addresses this issue. You can find it at

http://www.vcnet.com/measures

Also, an electret condenser microphone is beneficial for those who do not
wish to sound like castrati on single sideband

Well said, Charlie! Now get ready to duck when the pro-coders hurl insults, flames, and all sorts of vilifications at you.

Please don't give up, though ... keep voicing your opinion and try to corner your local CW olde fartz and convince them ... you'll fail to reach most, because they're incapable of flexibility and rational thinking on the subject, but occasionally you'll gain a convert and that's worth the effort.

73,
Carl - wa6vse

keep the code, educate the applications. what is easier to build after learning
the important theory behind it? a cw transceiver or a phone xcvr or atv counterpart?

while the wpm req is probably high for today's standards, code is a great thing
to have knowlege of and should be a required part of the licensing system. perhaps
not such a block to the hf bands but should be in the mix. i personally
frequent other modes of operation with atv being my latest project for
my multi-cast repeater system. still yet, cw come into play whenever a
minimalist/survivalist notion comes about. i have built [as countless
others] a cw transceiver that is powered by alternate energy. it has 4
rechargeble AA batts that are charged either by sunlight or wind power.
this really sparks the interest during field day and open houses at the
club meetings.

not so, just about every security oriented solution has cw as backup. i do advocate relegating cw to backup as it's major role but as important a requirement as any other. what happens in the thousand what-if scenarios when a homebrew min cw xcvr is the last means of communications?

>

the code deciphering programs on my BBS are among the most popular. kids still like that "secrect code" idea. i agree that it should not keep them from certain bands and such but still should be a requirement along with more intense theory.

>
> If we were genuinely interested in perpetuating this hobby, we would
> dump CW outright

i think this would be a giant step in the wrong direction. while i advocate revamping the code requirements/restrictions, i still feel it is important.

> and shift focus towards computers, packet, ATV, and
> satellite communications. See a theme here, ladies & gentlemen?
>

i have been a computer pioneer for over 20 years, i can't wait to get all the new and improved stuff but would be "just another appliance operator" without the experience and training on all the old antiquated hardware, software, programming concepts.

> For the record, I am a ham & got my ticket long before no-code, so I'm
> not playing sour grapes here.
>

i'm new to the ham radio world but not to the fun stuff it encompasses. years of 11 meter listening/disecting sparked while vhf lo/hi police band fueled the fire. a ham came to the electronics repair store i frelance for and suggested i take the exam that was being held in 10 days. they would love to have me he said. well a trip to the radio shack 30 minutes away brought me a no-code manual, a general manual, and a 4 tape code course.

with no previous code training [except for the morse code chart on my walkie talkies as a kid!] i came away with a general class ticket in one test session.

i guess my point is that if someone wants something and is on fire for it, he/she will do what is required to get it.

if they drop the 20wpm before i upgrade adv/extra, that will be fine. if not i will be ready for that too.

```
> No biggie. Just my opinion.

absolutely, no need for flames in this group.  plenty of non-hams and
prospects reading here to see what it's all about.

If code testing ended, what would prevent you frm building
a CW transmitter anyway?  The issue isn't to end the USE
of CW by those that want to use it for DX, QRP or whatever.

>while the wpm req is probably high for today's standards, code is a
```

>great thing to have knowlege of and should be a required part

Not any more in terms of those that are truly active in the
survivalist and safety aspects of CW. There hasn't even been
a viable use of CW in an emergency condition in years.

> i have built [as countless
>others] a cw transceiver that is powered by alternate energy. it has 4
>rechargeble AA batts that are charged either by sunlight or wind power.
>this really sparks the interest during field day and open houses at the

And why should that end if CW testing as a requirement ends?

>> Morse code is the 90's equivalent of smoke signals. It's a quaint and

>not so, just about every security oriented solution has cw as backup.

Please enlighten us on where that backup is being relied on?
The original statement is correct, CW has been abandoned as a viable
mode for any and all types of emergency communications, both in and
outside of amateur radio.

> i
>do advocate relegating cw to backup as it's major role but as important
>a requirement as any other. what happens in the thousand what-if
>scenarios when a homebrew min cw xcvr is the last means of
>communications?

The lack of even one credible example of that happening is
where the argument fails totally. You want every ham with HF
access to learn CW just in case someone on HF runs into
that situation? The economics of requiring CW today in
case of the one-in-a-million case is not justifiable. We'd be
better off and save more lives mandating all hams know CPR.

You still offer only yur opinion that we should have CW. You offer
no reasons why.

>> If we were genuinely interested in perpetuating this hobby, we would

Radio engineers and techs do not require CW knowledge to
be competent. Neither do hams. As a Navy technician, I never had to
know more code yet I had no problem at all maintaining and
repairing any of the shipboard electronics we had.

Wonderful, but that is not the norm, especially as it relates to the
code.

>i guess my point is that if someone wants something and is on fire for

>it, he/she will do what is required to get it.

That's true, but what is required should be justifiable in terms of
why it is a requirement in the first place.

>if they drop the 20wpm before i upgrade adv/extra, that will be fine.

I really have to agree here. I can transmit information at 56KBaud using an ordinary telephone voice line. Why is it illegal to do exactly the same using an HF channel? Or a 900 MHz rig?

Do away with code???

Let me check my slide rule for a moment.

OK...... it seems that some people enjoy that mode.

I am one who does not. I perfer the computer. Why not require all hams to pass a computer test.... retroactive so that all the old CW operators (the ones who support CW requirements) can get up to speed with modern communication methods.

Does that follow current logic?

William Lee

Hi All

1.I have a Heathkit SB-102, pwr Supply(Model# HP-23), & SB-600 speaker for sale or trade. Radio has hand mic with it, in excellent condition, xmitter needs alignment and have extra set of tubes with it but unsure if they work, never had them in the radio. Books and manuals included. $250.00 OBO plus shipping

2.Dentron GLA-1000 HF Amplifier, in excellent shape with manual and scematics. $400.00 OBO plus shipping

or I would rally like to trade all of this for a Kenwood TS-140 w/MC-50 and Speaker. I'd pay for my shipping and you'd pay yours. Also would consider other rigs but I like the simplicity of the TS-140 .

E-mail or phone Bob Lott "KC7OSZ"
rll@premier1.net or (360)424-8289 if I am not home leave message and I will return your call or e-mail.
Thanks Bob...

hmmm. i seem to recall that i responded as a pro-code to his post
without any of the above stated negatives. read back a few, you make
yourself sound close-minded which is what you are trying to imply about
pro-coders below. \/

> Please don't give up, though ... keep voicing your opinion and try to
> corner your local CW olde fartz and convince them ... you'll fail to reach
> most, because they're incapable of flexibility and rational thinking on
> the subject, but occasionally you'll gain a convert and that's worth the
> effort.
>

now that paragraph is a flame. you warn that procoders are 'going' to
do
what you have already done. cw is not my preferred mode of
communicating
but i do feel it is and will always be an integral part of
communications.
the no-code ticket did alot to open ham radio to those not interested in
cw.
many delve into the code and upgrade because their club displays a
positive
attitude toward the code and the incentive idea. rather than treating
it
as an impossible obstacle, it's shown to be a fun and still useful part
of
radio. there is a way thru the code! i'm 29 and went from no ticket to
general class at one test session with 10 days to learn the code. i did
it
because i really, really, wanted it! so i did what was required to
reach it.
if the code is gone when i go to get my adv/extra ticket that is

wonderful,
if not, then i will be ready for it.

William,
Remember, it is not new technolog, but stuff left over from greek ideas - concepts. Just like airplanes... they ain't new, heck the first cave man had the basic idea... and kitty hawk does not mean anything.

WELL HERE GOES!!! I'm sure I'll get harassed like crazy for this... Well, I got the mod to work.... FROM 50-999mhz.... NOW heres the problem.... I CANT TRASMIT anywhere..........The ptt light doesnt even light up... When I hit my 'knob' button to make settings and you're supposed to hit PTT to confirm & save it... I have to hold the KNOB down to save it.... I'm sick.......I should've left well enough alone! CAN ANYONE HELP ME?????? PLEASE??????? I've learned my lesson!!!

If I can just get it to transmit where its supposed to I'll he a happy ham!!

THANK YOU!!

NOPE....not locked......I was on the phone with yaesu for about 30mins today trying to figure it out......I mailed it in to them to repair.. Didnt tell them the cell mod was done, just that I got it for a christmas present and it suddenly stopped transmitting........If they can get it back to normal I'll leave well enough alone!! :) Like I said the mod worked perfectly but I must have either accidently powered it on the incorrect way or something..... normally when you change settings via the knob and go to the menu.. you normally would push the ptt to save & confirm the setting, well it wouldnt even do that.. The ptt didnt work at all........We'll see....Like I said I fedexed it today.. hopefully I'll have it back in a few weeks in working order!!!

Thanks for the post..

MARK

Unfortunately you will most likely get a nice note telling you that you
have voided your warranty. The mod is probably the first thing they will
look for and in the unlikely event they do just fix it, they will be
required to undo the mod when they send it back to you.

Joe

These rigs are commonly selling for around $1000 so why is yours worth $1450?

The IF-10B is very difficult to find and worth quite a bit when you do. The two CW filters will cost your around $140 used and the SP-940 speaker comes with switchable audio filters and goes for around $150 when you can find them used.

So while a really clean 940SAT usually goes for about $1100, those extras can reasonably take the price up into the $1450 range. If the rig has a high serial number, the seller might be able to get his asking price. More than likely, though, he may find he has to come down closer to $1250-1300 for a quick sale.

<sound of two cents hitting the table top>

I would take a guess and say that the problem is probably the actual switch inside the radio, since the three button switches on the FT-50R (10R etc) have a tendancy to go bad and require replacing.
I've done the cel mod to my radio and have had no problems, however over time I have had my LAMP button and my PTT button go bad, thus need replacing the switch inside.

Have fun.

Can't help you. I'd like to buy a FT50 if I could get it to go down to 70mhz. I fly R/C on 72 and it would be handy to listen to signals down there...

Check PTT Lock function. Also, try CPU reset, and remember, a LOW battery may make rig receive normally, but not transmit.

Good Luck!

This is my first time posting to a NewsGroup, so I hope I get it right! I have an old radio that belonged to my father and I would like to know more about it (when made, amount produced, value etc.) Can anyone out there help? Its a General Electric X-371 Receiver. It is a large table top radio 24inches wide, 15inches high, 15inches deep and weighs about 50lbs. It has a magahony cabinet with front speaker and shows 12 bands in a semi-circle in a front window. With it I have a booklet called "International General Electric Radio Handbook" produced by World Radio

Handbook, this was prepared by O.Lund.Johansen of Hellerup, Denmark. This
radio would have arrived in our house about 1957-58. I live in
Newfoundland in Canada and am interested in setting up the radio to listen
to shortwave, and I would like help on type of antenna which would be best,
cheapest, easiest to set up? Any help would be appreciated, thanks

That's sounds like a great radio. It was probably built before WWII,
in the 1930's. If the tubes are still good (and they *should* be), it
will give you many hours of pleasure. I would use a long wire antenna,
and be sure to ground the chassis IF there is a connection on the back
of the chassis. Be careful, though, some of these radios had a *HOT*
chassis (one side of the 115 v line is on the chassis)

Hi Don,

The simple antenna solution is to hang as much wire in the sky as possible. Make it easy on yourself at first, and do it in stages until you see no further improvment at the lowest frequency you are interested in.

There is a more serious issue to be taken care of before the antenna. If this rig has not been turned on in a number of years, there may be a fire hazard. The filter caps in the power supply are undoubtedly getting on, and these items do not last forever. Flipping on the radio may give you a hiss and several stations, and give the impression of being in a working state. This may be a false security. There may also be no problem. The compelling evidence will be a small explosion (fully contained within the radio) and smoke and/or flames afterward if not unplugged.

The technical solution is to plug the radio into a variac and sloooowly raise the variac output over a period of hours (or days) from 0 to 115VAC. This will allow the old electrolytics to re-form their chemistry (if you are lucky) and let life continue as though no years have passed. Many of these radios work quite well after this slow wakeup call. Simple evidence of how robust they are is in the amount of 60/120 Hz hum you hear with everything turned all the way down. This can vary from zilch to Mt. Saint Helens rumble. Anything above 3 on the richter scale suggests replacement of these power components ($20 for parts (before markup) and $100 labor).

73's and happy DX'ing

David,
push KNOB & MON then power on then immediately hit your FW key which is the Function button......

That does a CPU master reset....

Try the rec.radio.amateur.boatanchors newsgroup. (boatanchor is the
affectionate name given to old, heavy tube radios.) There are a lot of
enthusiasts of old radios on that group. Someone there can give you
info on your X-371.

Agreed.....

But runing up with a variac also reduces the fil voltage...so while it
puts less B+ on the caps it also reduces tube life...they dont like
being run at a lower voltage and develop "Cathode Scaling" (junk
deposited on the cathode that requires a period of OVERvoltage to
remove).

I always break the center tap of the B+ transformer and insert a series of resistors, starting with 1Meg for a day, then 1/2 Meg..and so on thru a few K until the Caps are fully reformed....

Of course if the poster of the origional int a teccie he could be (un)pleasently shocked during the process!

Does anyone know the correct procedure for modifying the 1000MP for MARS? I am licensed and active MARS op (AAR2CF) but after 3 months I am still waiting to receive my actual license in the mail, and YAESU will NOT give me the procedure without that license.

The mod for the 1000 is available, but I don't think it is the same for the MP.

Please reply email direct. Thanks in advance.

I have for sale a Vibroplex chrome DELUXE iambic paddle with custom chromed four-button memory keyer bar attached to right side. This is a VERY beautiful paddle, in mint (absolutely like new) condition, with red fingertips. Memory buttons (also red) are set up for AEA MorseMachine, but will work with any modern memory keyer (or can be removed if you wish). Very special... $125.00

This handbook is probably a collectors item. Johnansen is the original editor of the World Radio and TV Handbook (WRTH) that we buy every year. This year being the 50th year of the WRTH's publication, they had a historical article about Johnansen and his Handbook.

Enjoy!

Hi Rex,

The effect on the cathode you are speaking of is from long-term variations of nominal operating voltage. As to the life expectancy, it is quite the opposite. The age of a filament varies by the fourth power of the current applied to it. A 5% reduction of current will lead to a 22% increase of life. However, this is not a practical application for us given such life considering measures also have an impact on the cathode's ability to boil electrons off into the plate current. The cathode scaling you speak of is oxidation and a sign of the cathode being cool. I've commonly "descaled" cathodes by applying 1-2 Kv between the cathode and the first grid for 10-20 seconds, and minutes for a tough dog. These measures are of course last resort attempts not ongoing maintenance items.

Another posting alerted our friend to the ground hazard that may exist. This is a very real threat (it is a 70 V problem derived from the early practice of tying both side of AC mains to common through noise capacitors). When I was in the Navy, I was in charge of a TV/Radio repair project the Navy put on for S.F. charities. We took in 300 TVs and 200 Radios and turned out 125 TVs and 180 Radios in two months with a budget of $50. This was, for my students and staff, the University of Hard Knocks advanced studies program. Real electronics, not blackboard electronics.

One student learned about this hazard the hard way. He assumed that because our ground buss was so long, that it would support TV signals by merely attaching the antenna lines to it. I commended my student for his intuition as he plugged in the TV. We watched as the insulation on the wire drooped off like snow from a telephone line; smoke followed, and then a cheery red glow. It was very instructive (and one reason why I taught my men to keep one hand in their pocket, or behind their back; at sea, everything is at ground potential except you, the load).

Don - This sounds like an interesting radio. It shouldn't take much of an antenna for you to get European stations. You could get a 20 foot (7 meters) length of any kind of wire and hook it on to the antenna terminal(s) and see what happens. It would be helpful to know what kind of terminals are on the back of the radio. Also, when you start using it for more demanding applications (like SW), you might find that some of the tubes are too deteriorated to perform well. They may need testing and replacement.

What does the "International General Electric Radio Handbook" say about
antennas? Is this a manual for this radio, or a general short wave
manual?

Cheers

Dave, K9SW

David,
Check with your friendly power company or telephone company. They
have post hole diggers (hand type) that are long enough to handle
your job. Good luck.
Bill

Hi David,

Just before christmas I had a 55ft crank up/tilt over tower erected
here. The guy who installed it used a post hole digger to about 4ft
deep (as you mention), but after that he had an orgre bit to continue
to approx 8ft down.
The orgre bit consists of a circular cutting ring, just like a big
hole saw, but with the top open. Mine was about 12inches diameter,
with a wall height of about 6 to 8 inches.
The orgre bit must be the diameter of the hole you are digging.
The concept is that you cut into the earth creating a circular cut
around the circumference only.
With a crow-bar, or heavy steel pole, you must then compress the earth
inside the orgre after you have cut into the earth. Once the earth
inside the bit is compressed, you can lift the orgre out of the ground
and the earth will remain inside the bit.
A few hard whacks on the surface will remove the compressed earth from
the bit, and you can start over again.
The concept is a bit slow, but it works well.
The deeper you go, the more clay (and harder) the earth gets, this
makes the concept better, as the more dense earth tends to stay within
the orgre bit as you lift it out of the hole.
Let me know what you think.

Baton Rouge, La.

Three years after setting up this station here in Baton Rouge, I've been transferred to FLa. I really would like to leave the antenna system intact when the house is sold, but if I have to, I'll sell it seperately or take it with me.

This is a charming 3Br/2Ba 1670 sq. ft. brick home on a 110' X 150' lot in an established subdivision which has NO ANTENNA RESTRICTIONS. The house was built in 1960, was completely remodeled three years ago, has a chain linked fenced back yard, 4 huge and beautiful "Live Oak" trees (2 in the front and 2 in the back), and is 2 blocks from the elementary school. With the property valued at $85,000, the taxes last year were $61.00.

The Antenna System consists of: Commercial grade extreme duty aluminum 80' self supporting motorized crank up tower which I had custom built. This is a triangular tower measuring 36" per side at the base. Rotor is a Yaesu variable speed G1000SDX. 15' of $10/ft. extreme heavy wall mast puts the KT34XA KLM beam (2 years old, had a mosely PRO67B up for first year) at about 92'. 10' below that is the Cushcraft "Skywalker" 2 element 40 meter beam (also 2 years old). An Ameritron five position switch box at the 40' level directs the 5 element 80 meter half wave sloper array (f to b ratio confirmed many times by DX stations to be at least 20db.) At the 80' level is a 13 element Cushcraft 2 meter beam on a seperate side mounted rotor. All coax (mil spec RG213) and other cabling is neatly bundled and enters the shack via the attic and internally through the inside of the walls. The ground system consists of 2,800 feet of #4 bare copper wire buried 6" deep in a grid with 10' centers throughout the entire yard. (the neighbors REALLY knew I was a lunitic when they saw me putting it in) All junctions are soldered...and the whole thing is tied to four 8' ground rods under the 6' deep tower foundation(6' X 6' X 6' of 4000lb psi peagravel concrete with 180 lbs of tied rebar), four ground rods at the far corners, and 2 rods on the sides of the house. I put this station on the air in Jan '93, and since that time I have compiled in leisure time 302 countries confirmed (all bands), 5 Band DXCC (plaque dated March 27, 1995), 216 confirmed on 40 meters, and 186 on 80 meters. Last year I strung up a 160 meter inverted vee for 2 week ends and won CQ 160 meter phone contest for the state of Louisiana.

The rest of the station which I'm taking with me regardless, is a Kenwood TS950SDX, Ameritron AL-1500, and several hundred pounds of various other junk.

The price for this very nice home with all antenna equipment mentioned above is $84,900.00. I might point out that property values in this part of the country are quite low compared to most of the rest of the country....as are the taxes. La. has a $75,000 "Homestead" Exemption, which means that the first $75,000 of a home's value is tax free.

The antenna System alone is $5,000.00 (I've got almost $9,000 in it) I'll take it down, you ship or haul it off.

Help!

I was intrested in the navy MARS program, but I can't find anywhere to get information on it. If anyone could help me out in anyway, I'd REALLY apreciate it. Thanks!

Ben, A few months ago I was looking into the MARS and the only way that I found out about it was by jumping on the internet and typing in "MARS" and that took me right there. It would even tell you who the regional person was for where you lived. I will see if I can find the address for you.

Good luck 73's,
Jay Tombre N7ZHL

I don't know how high this tower is... but you are going WAY too deep

Unless you nave need to go that deep for most towers of a modest size a
4ft by 4 ft block of cement is all you will need... You may want to dig a
post hole sized section in the bottom of your 4X4 hole down to 6 ft or more
to make you feel good.

One of the Main things to remember is to use Lots of re rod... The steel is
what makes the cement strong.. at it is cheep..

Remember too... to place that cement you are going to have to figure out how
to move it from your driveway to your hole... 1 1/2 yard of cement is
heaver than you think   :)

73 my friend   Dean WB0TKC

YOu can also rent electronic POLE HOLE DIGGERS that will dig holes
from local rental companies..about 30-50 bucks a day

or try a shovel...

or have a tower rasing party and have your buddies bring tools an take
turns digging...i did this ..i supplies the burgers and dogs they came
with the liquid refreshemnt of thier choice an we dug 4 0r 5 in the back
yard...xyl had a fit....

DON good luck an 73

GLOUCESTER AMATEUR RADIO & ELECTRONICS SOCIETY

GLOUCESTER - ENGLAND

If you live in or around Gloucester and are interested in electronics, robotics, microprocessors, computers or amateur radio our society could be for you!

We meet every Monday evening from 7-30 p.m. to 10 p.m. at Churchdown School, Winston Road, Churchdown, Gloucester and offer a varied programme for the electronics hobbiest.

If you'd like to know more why not come to our Open Evening on 10 March.

Further details about the Society can be found on our web pages at http://www.furcot.demon.co.uk/gares0.htm or by sending e-mail to gares@furcot.demon.co.uk

NASCAR WINSTON CUP SUNDAY NOV 10

Hi
I just learned that Winn Dixie wants me to drive one of our special
tractor trailers in the 10:20 AM parade at this Sunday's Winston Cup. If
you are a ham and happen to be attending this Nascar race please give me
a call on 146.520.

We can compare scanner notes etc. during the race.
My ticket is to the North Turn Grandstand Sec 220 Row 37 Seat 16

73's

For sale:

Military transceiver, type R159, 30 to 70 MHz in 1 kHz, narrow-band FM, with ALL accessoires

Transceiver is of very recent design (late 80s) , in use today with the Russian forces as the standard man-pack field radio

Radio is very compact and rugged, for use as back pack radio or vehicle radio. It is NOT a boat-anchor, it is too recent and too light for that.

Some specs:
- RF power: 20 watt
- Narrow-band FM
- Supply voltage: 12V DC from Nicad (3 of these 12V NiCad packs included, never used)
- Antenna: Wire antenna or whip (included)
- Microphone/headset included
- Transceiver has built-in automatic antenna tuner
- Manuals included

This transceiver is NEVER USED. Is packaged brand-new in its original wooden crate, with all accessoires.

Sell for $600 , shipping not included

Thanks for the tip, but I found the filters , a ham in California had them
They are exactly what I was looking for

My Collins 651S-1 receiver works perfect now

Appreciate your response anyway

Thanks,

Loek

REPONDEZ SEULEMENT DANS alt.config ou/et par e-mail .
(sorry for my poor english)

I propose this newsgroup.

I want to create this newsgroup for all the ham-radio and SWL who speak french (not only in france) and want to speak about radio .

The newsgroup i propose , mustn't be and commercial radio goup .
The subjects may be : the shortwaves (SW), the VHF UHF ... , and somes

others thing how digital , cellular ...
all of the radio (no - commercial) and ham-radio the listeners of course !
There is a newsgroup named : alt.radio.scanner , but it is in first for the USA , i want this newsgroup for French speaking .
Yes you can say " why not an fr.* group ?" at this i say you : for an fr.* newsgroup this is very long and there is a big problem : the law !!

I france the scanners are not illegal but this is illegal to speak about this (buy it , dont use it), this is legal in all the world !

now the question is :

are you ok for alt.radio.scanner.french

send your replies in alt.config and/or via e-mail
yann.BERENI@hol.fr

FRENCH TEXT

Je propose ce newsgroup .

Je veux creer ce newsgroup pour tout les radio-amateurs et les �couteurs de radio qui parlent francais (pas seullement en France) et qui veullent parler de leur passion : la radio .

Le groupe que je propose , ne doit pas etre un newsgroup commercial .
Les sujets peuvent etre : les ondes courtes , la VHF ,UHF , ... et bien d'autres choses qui font partie de la radio et du radio-amateurisme et bien sur les ecouteurs !
Il y a deja un group nomme alt.radio.scanner , mais c'est en premier pour les USA , je veux cr�er ce newsgroup pour que les francophones puissent s'exprimer .

Oui vous allez me dire " pourquoi pas un group fr.* ?" a ca je vais vous repondre que c'est tres long pour creer un group fr.* , et le plus gros probleme c'est qu'un tel goup sera reffuse en fr.* car il y a la loi !

En france les scanner ne sont pas interdits , mais il est interdit de parler de ca (achetez mais n'utilisez pas)
Remarquez que c'est legal dans le monde entier !

Maintenant la question est :

etes vous d'accord pour alt.radio.scanner.french

Envoyez vos reponses dans alt.config ou/et via e-mail

yann.BERENI@hol.fr

From: em@mediacity.com (E. Monberg)
Subject: Audio Companding 72-126 MHz FM Receivers (90db s/n ratio)

Date: 1996/12/02
Message-ID: <em-02129600513600010@208.138.21.92>#1/1
X-Deja-AN: 201832424
organization: MediaCity World http://www.mediacity.com
newsgroups: rec.radio.amateur.misc,rec.video.cable-tv,rec.ham-radio,rec.radio.amateur.equipment

Studioline COMPANDING FM RECEIVERS with up to 90db audio s/n ratio for Cable (and other RF Distributed) Audio (VIEW PHOTOS at: http://www.lasermotion.com)

THEY ARE: Three receivers in one box with "F" connector input,
and RCA phono outputs for two channels of audio.
Two receivers are audio channels, and the third receiver
is dedicated to control and programming functions.
The Studioline unit is fully software configurable.

THE PRICE: $ 37+shipping/each Receiver.
$185 / 5 units, we pay shipping
$ 15 (US postage paid) for schematics
(Original Large Quantity Manufacturing Cost in Japan = $321 /each)

THE STORY:

Studioline technology for economically distributing truly studio-quality audio programming over existing Cable & Wireless broadcast systems was originally developed by FM Systems, Inc.., Santa Ana, CA. with funding provided by The Chronicle broadcasting company in San Francisco, CA. We acquired the equipment and rights. Pricing is very affordable. Subscriber Receivers Are Now Available by FedEx next-day shipment from Hayward, CA. Head End transmitters are available inexpensively from FM Systems, Inc., Santa Ana, CA.

*** COMMERCIAL APPLICATION EXAMPLE: ***

PUBLIC CABLE AUDIO APPLICATION:

COSTS: Estimated to be less than 25% of the cost of Digital Music Express (DMX).
We offer financing, and maintain an inventory of exchange and installable units at your facility.
HEAD END: (Photo)
FM Systems, Inc. Transmitters: Each 19" rack chassis of 3 Stereo Channels is $4750.
SUBSCRIBER END:
Studioline Receivers: $37/ea. purchase, or $3.91 per month rental.
BREAK-EVEN POINT:
As few as 200 installed units at a monthly fee of only $5.95 per subscriber.

*** RF CARRIER SPECIFICATIONS: ***
Frequencies: 72- 76 MHz = 9 Stereo Pairs.
108-126 MHz = 60 Stereo Pairs.
Bandwidth: 300 KHz per stereo pair.
Level on cable: -15 dB to -25 dB/video.
Negligible cable system loading. (!)

*** AUDIO SPECIFICATIONS: ***
Signal to Noise Ratio: As high as 90 dB.
YES - That is NOT a misprint !!
(80 dB audio demonstrated at 35 dB RF carrier/noise ratio!)
Designer tells of "Excellent Audio Signal decoded
on a terrible (!) system WITH 65 AMPLIFIERS IN SERIES !
The signal was OTHERWISE USELESSLY NOISY but Studioline recovered it".
Frequency Response: 15 Hz - 20 KHz, �1.5 dB.
Harmonic Distortion: Typically < 1%.
Stereo Separation: 70 dB, 20-20 kHz.
(There are two completely separate
high sensitivity audio FM receivers,
each with a low-noise Compander Section)
Audio Output: 1 Volt, low impedence
Ready to plug into "aux" or "tuner"
inputs of customers' existing premium stereo systems.

*** PROGRAM SOURCES: ***
Many special interest audio programs from satellite.
Numerous ethnic language broadcasts..
Music for any taste, education, and local live entertainment,
concerts, symphony and events.

*** OPERATING, and OTHER FEATURES: ***
These are completely software driven,
flexible devices,all programmable from the cable "head end".
The design team is available for consultation or for
modification of the design.
With "flag" signals on distribution cable,can utomatically sense
channel TV is tuned to, for true studio sound to accompany video.

Very high quality, and attractive looking receivers
Manufactured in Japan.

14" Wide x 10" Deep x 3.5" High. 7.5 lbs. 105-125VAC. 25 Watts.
Unique frequencies and modulation technology make for
theft-proof and secure channels.
Addressable and authorizable from head end over cable
by individual channel and unit serial number.

*** APPLICATIONS: ***
PRIVATE CABLE:
in HOTELS, RESORTS & SPAS.
PUBLIC CABLE:
Enhanced and premium cable service and

pay-per-view movies.
Precisely targeted outlets such as Muzak franchises,
Hotels, Discotheques, and Lounges.
Live broadcasts of entertainment, symphony and special events.
Any time the special presence of studio-quality sound!
(Or two completely separate audio channels)
can make a difference to your performance and your subscribers.
THEATRE MANAGEMENT:
Distribution of up to 60 separate channels of sound
FACTORY ENVIRONMENTS:
Broadcast and directed paging.
BACKGROUND MUSIC SERVICES:
High quality sound for a change
PUBLIC INSTITUTIONS
Simultaneous Translation Services in Senates Parlaments and other groups.
This is a bargain and will not wait long !

Need a new home for e-mail? It has come to my attention that alot of
brother and sister operators are having trouble with e-mail.
Thunderhead.com offers e-mail services starting at 5.00 per month and

for Hams a 1 time charge of 30.00. Beats the regular price by half.
For more information e-mail sales@thunderhead.com.

Mike

Or, if you just want e-mail, try Juno ... it's 100% free. Just e-mail your
name and address to signup@juno.com, or phone them at 1-800-654-5866.

Even though I have a "paying" account, I keep an account at Juno as a
backup. You never know when a server is going to go down....

Hi,
My 20 watt transceiver has a burned out transformer . To purchase one new
it will cost me quite a few dollars.
Is there anyone in the Sydney area that could fix it for me......or is
willing to sell me a second hand cheap unit (as spares).

Please mail me at

conn@magna.com.au

Thanks in advance

I have recently come to own a previously used antenna tower. After months of hard work, I managed to finally get it out of the ground. That was the hard part. But here is the fun part. Anybody have any ideas how I can dig a hole in the ground that is about 2.5ft in diameter and about 6.5ft deep? I tried a post hole digger, but the bits are only about 4 ft deep? Any suggestions?

Thank you in advance.
David P. Hummel, Jr.

David,

Contact your local utilities company. They often have drilling rigs to

put down telephone/light poles. I use one from a private electrical
contractor. Please be careful on your "new to you" tower. Contact the
manufacturer for proper guying procedures/anchor specs. Please inspect
it very carefully for rust, corrosion, etc. Check inside tubes if not
solid rod. Update life insurance policy!

Any of several solutions come to mind. The folks that dig septic tanks have equipment to dig holes like what you describe. They are usually quite reasonable. Any good backhoe service would be able to dig it for you. The folks who dig piers for house foundations also are able to move dirt.

I had a tower base dug, and the cost was only about $50 from scratch.
On another job, where the machinery was already present for another purpose,
it was a "freebie".

Good luck es 73 de W5GFE

A bit of advice on using a backhoe to dig the hole for a tower. All tower mfgs strongly suggest you NOT use any back hoe type digging. Reason is you need to dig the hole straight down, pour concrete and let the concrete use the sides of the ground as part of its support. If you backhoe a 45 cubic foot hole you cannot "backfill the excess hole after the concrete form is poured. The backfill cannot support the lateral tension of the concrete.

I just did a 4x4x6 hole two weeks ago. I used a post hole digger making a 6 hole grid and then cleared the rest with a shovel. Think of gravedigging, I know I did.

Mark

David, This is a very uncommon size hole for a tower. Most guyed towers are set in this size hole, but not this deep. Most self supporting towers are set in much larger holes depending on the height. Most larger towers use 4 holes about this size, one for each leg. It would help if you state what type tower you are putting up and the antennas you plan to put on it.

I had to call a pier drilling truck (they also set poles for the utility company). They charge anywhere from $60 to $100 per hour from the time they leave their shop. They can dig a hole like this in 30 minutes in normal soil or a couple of hours of so in rock. It cost me $480 for 8 hours to dig my antenna holes in rock. There were four 18 inch x 5 1/2 ft and 1 30 inch x 4 1/2 foot plus a 9 inch x 9 foot trying to get through the rock for a ground rod, but it never came out the other side. Good Luck.

You can rent a small (very small) backhoe or trencher and dig the
proper hole. Alternatively, see if you can catch someone in your area
that is having some septic, sewer, drive, or other excavation done and
offer the guy running the equipment some cash to dig your hole.

A good back hoe operator can dig a straight hole. I've got a 5 x 5 x 8 tower footing in my back yard and it was dug in about an hour by an experienced operator using a two-foot bucket.

I second the motion. We have a backhoe man here (Ada, Oklahoma)
that I swear can do almost _anything_ with a backhoe. It never
would occur to me to use the word "delicate" with regard to
a backhoe, but this fellow is a pure artist!

Another idea... I just finished a 3 x 3 x 6-ft hole. Cut through a
4-inch concrete deck slab to get at the dirt. Dug straight down with
long-handled shovel. Tied rope to handle where it enters the shovel.
Made it _MUCH_ easier to get the dirt out when the hole got deep.
Enlisted XYL to handle the shovel; I did the pulling on the rope.
Dunno who came out better!!

Good day one and all.......

David as for the backhoe, forget it......I've spent a number of years running one and unless you have one of the really small ones, you can't dig a hole 2.5 ft. in diameter and 6.5 ft. deep. It just can't happen and leave the surrounding ground undisturbed. Sorry.

Having spent some time in the world of construction, the way I see it you have 2 choices. 1. Gat a shovel and someone with a small kester that can dig and fit into a 2.5 ft. hole. Yes, I know it is not very likely but, it is a way. 2. Talk with the local electric company. They have a truck that is used to set electric poles which has an auger that can dig a round hole. Most of these trucks will dig somewhere between 18 and 30 in.. Some have differant sized augers to dig the needed dia. hole.

If you can talk them into digging the hole you may have to exchange diameter for depth. I'm sure there are some eng. type folks out there that can give you the numbers but, I would thing 18-20 in. dia. and 8-9 ft. deep would be a good exchange for the requested 2.5 ft. x 6.5 ft.. Remember, put some re-bar steel in the cement base to hold the thing together.

Hope this helps......and please I'm not trying to put anyone down on the backhoe deal.....It's just that the physics of the way they dig that won't let them do this paticular job.

73's and good luck with your tower.......

Bill   N5WO

Why dig a hole 6.5 ft. deep? Unless the tower is really tall and self
supporting, you would be better with a hole about 3'x3'x3'. Suggest you
try to get hold of a copy of the Rohn or Heights tower manual. They
give suggestions on how to design and make tower bases.

If the tower is guyed, you can get by with a much smaller base.

73,
Art Eberle

Hello David;
I know noone wants to hear the old macho story about how
an induvidual completes an unbeleivable feat , but it was worth
the exercise and $$$ saved when I dug the base of my tower...
My tower is 80 ft , guyed, and the base is a 3 ft base section of
Rohn 25 sitting on 24 " of gravel (big chunks). My tower has
taken 2 direct strikes (I think that's all) and I could not ask for
a better ground as the rest of the shack remains unharmed. I dug
the hole with a post hole digger . Created a hole about 36" in DIA
and about 5 feet deep - so the top of the 36" section is flush with
the surface of the ground . Sitting on the gravel and who knows

how many miles of GA clay , the base is plenty sturdy after backfill.
Speaking of which : after you backfill you need to let the ground set
backup with frequent wattering.
I also had a guywire break once and the tower still hardly budged
I Have a 4 element Quad on a 30 foot boom up there .
Consider what ur putting up there first . and always listen to all the
great advice from those " who have been there - done that "

>
> Having spent some time in the world of construction, the way I see it you have 2 choices. 1. Gat a shovel and someone with a small kester that can dig and fit into a 2.5 ft. hole. Yes, I know it is not very likely but, it is a way. 2. Talk with the local electric company. They have a truck that is used to set electric poles which has an auger that can dig a round hole. Most of these trucks will dig somewhere between 18 and 30 in.. Some have differant sized augers to dig the needed dia. hole.
>
> If you can talk them into digging the hole you may have to exchange diameter for depth. I'm sure there are some eng. type folks out there that can give you the numbers but, I would thing 18-20 in. dia. and 8-9 ft. deep would be a good exchange for the requested 2.5 ft. x 6.5 ft.. Remember, put some re-bar steel in the cement base to hold the thing together.
>
> Hope this helps......and please I'm not trying to put anyone down on the backhoe deal.....It's just that the physics of the way they dig that won't let them do this paticular job.
>
> 73's and good luck with your tower.......
>
> Bill   N5WO

When I was a kid the electric companies did not have truck-mounted augers and dug all of the holes for telephone and power poles by hand. I have watched them do many and remember well the tools they used. One long-handled spade was used (intermittantly with a very long crow-bar) to loosen the dirt (usually hard clay with imbedded rocks). Another long handled shovel had much of the blade formed to a ninety-degree angle so as to provide a means for lifting the loosened dirt out of the hole. As I recall the holes were at least six foot deep or considerably deeper. Two men would easily dig two or three holes per shift.

For a single hole I would expect you could make do with some jerry-rigged equivalents of the tools I described above. The technique is the thing. Loosen a few inches of the packed earth and then lift it out of the hole. And then just keep at it until you have reached your goal.

The size of the base needed depends very much on local soil mechanics. The tower base serves two purposes. It bears the weight of the tower, and any loading that guys may impose. And it serves to resist the overturning moment of the tower. Different soils can support different ground pressures, and different soils have different resistances to shear. There is no "one size fits all" for this sort of thing, but in general deeper is better than wider.

Now my tower has almost a full section buried. In other words the hole is 10 feet deep and has 2 feet of aggregate in the bottom. I dug it by hand with a posthole digger. Not with an auger, with a real posthole digger. I started the hole with the regular handles, and changed to longer handles as the hole got deeper. It took two leisurely mornings to finish (too hot to dig in the afternoon).

For a 6.5 foot hole, the standard handles will suffice. You just have to get down and reach into the hole a bit to work them when you get down near the bottom, the standard handles are about 5.5 feet long. It will help if you replace one of the wooden handles with 1 inch galvanized water pipe, however, because the extra weight makes the posthole digger dig better. Even in the hardpan clay here, I can just drop the digger in the hole to get a bite, close the blades with the handles, and lift out the dirt. That's a lot easier than having to muscle the blades into the ground.

If you've never seen a real posthole digger, it is like two tile spades facing each other, joined with a pivot near the bottom. You drop it in the hole, spread the handles, which brings the spades together trapping dirt between them, and lift it out of the hole. Repeat as necessary until you are done.

Gary

Gee, Gary, you just blew your image. We all thought you were Hi Tek.

'Real hams do it on the giga hertz at 56k baud, and real hams dig tower holes with a post hole digger'. I don't know, something just doesn't seem to fit.

Personally I think post hole diggers are an obsolete, antiquated way to dig a hole that should be banned.   Why should today's modern digital hams be forced to have a post hole digger jambed down their throat just because they want to have a tower ? No commercial outfit uses post hole diggers anymore. They all have gas powered augers, and big trucks with giant drill bits. Why should hams be subject to using silly, outdated, antiquated tools for digging holes when nobody else is using them ? To suggest a ham dig a tower hole with a post hole digger is nothing but HAZING ! Just because YOU like having blisters on YOUR hands doesn't mean ALL of us have to like it. How about people with disabilities ? Do you expect disabled people to spend two days in the yard with a post hole digger just because YOU did it ? What about people who live in places where the dirt is REALLY HARD ? Should they be kept out of ham radio just because of your silly post hole digger hazing ritual ?

I think not. I think people should be able to just pick up the phone, call one of those guys with the big trucks with the giant drill bits, and let THEM come over and dig the hole for the tower.   Post hole diggers are keeping a lot of quality, qualified people out of ham radio, and it's time this hazing ritual come to an END !!! I am going to write to the ARRL and WARC 99 and tell them I think it's about time to get rid of post hole diggers for ever !!!

73, Jim KH2D

A German ham (DL1FAE) once told me, that there are CW phonetic phrases for each and every character of the Morse alphabet.

For instance, the phonetic phrase for the letter L in German is
Ich liebe Dich (I love you)
which when pronounced correctly, has the didadidit melody.

(1) I wonder if any DL/OE/HB-ham could supply me with the full list

(2) and wether or not something alike exists for the English language

I posted this query in some other group, and the first feedback gives me reason to believe that something of the like exists in the English language. From the UK somebody recalled:

Q ... God Save The Queen (dadadidah)
F ... Filling Station   (dididadit)

From the USA somebody recalled his father telling him about keyphrases they used in World War II Airforce Morse Code Training, curiously it was Q and F again:

Q ... Payday Today (I like that one, though I dont see the mental
connection between the phrase and the letter, but

maybe there is one which I only dont know about)
F ... Get a haircut (obviously, haircuts were due on Fridays)

I enjoy Gary's posts. He writes in an intelligent and courtious
manner. His explanations have helped me tremendously. You ought to
take this crap back to that other "newsgroup". You know the one where
the no-codes and the know-codes spend all their time sticking verbal
knives into eachother.

FOR SALE:

ICOM IC-32AT Dual Band Amateur Handie-Talkie package, in good
condition including original packing and accessories. Also has
extended TX mod on UHF, plus:

-built-in UT-40 CTCSS encoder/decoder
-2, BP-8 1400 mAH nicad battery packs
-1, BP-70 450 mAH nicad battery pack
-1, CM-16U AC wall charger
-1, cigar lighter DC cable
-1, HM-54 speaker/mic
-1, Headset w/ boom mic & PTT switch (Encomm brand)
-1, LC-43 'leather' case
-includes operation manual and service manual

Radio and accessories are in good condition. Price is $350 shipped
for package. Contact Phil WB9TAE via e-mail or call (608)276-7691.

I contracted with a "tree planter" (look in the Yellow Pages) who advertised digging holes with a Bobcat. I asked the largest auger they had, which was 36" !!!! $100 bucks later I had a perfect hole 36" across and 6-1/2 feet deep. My tower is a TriEx crankup to 51', and has been up 4 years now.

73, and good luck.

Well if you have any small kids around you could take two tall garbage cans with the bottoms cut out, tape them together bottom to bottom put in hole to protect against side cave ins. At this point the cans should stick above the ground about two and a half feet. Tell the kid you need the hole deep enough so the cans are flush with ground level. Give the kid a garden troll and bucket and I'll bet it takes the kid less time to dig those two and a half feet than it took you to get the tower out of the ground. Just one idea... Merry Xmas

Hey Jim,

I saw nothing in the quoted text that suggested he wanted a posthole
digger REQUIREMENT. Unlike the PRO-CODERS......

This project will be a monumental task, but hopefully the support of all
repeater Trustees / Owners / Users will help in this task. I realize there

are places like artsci that have the repeater books and ask for updates on-line, but there are so many repeaters that have been left out.

I am going to interface the data collected with as many of the not only on-line mapping programs, but those that are on cd-rom (AAA DeLorme Map'n'Go for example). The project, when completed, should allow you to enter a route from point "a" to point "b" and show all repeaters within a selectable distance from your route with the selected parameters.

EXAMPLE: I want all 2 meter and 70 cm repeaters that are/have:
1. a phone patch
2. open
3. linked / crossband system
4. emergency power
5. LiTZ

The graphical view would show selectable icon or number in the exact location of the repeater. The user can bring up the data for any repeater by clicking the icon / number and print the information telling you at what Point in your trip the repeater is within the range you have selected and when you will be out of the selected range.

Please send the information ONLY ONCE and I ask that ALL information listed below be 100% exact (only makes sense to have accurate information for an outstanding system). I also request that, if at all possible, ONLY the OWNERS and TRUSTEES submit the information (they would have the exact data needed).
Any information not received for repeaters listed in The ARRL Repeater Directory may or may not be included in the program. I will publish a listing of the information on The METRO Net homepage so you may see if your repeater information has been received and who submitted it. If there are any other suggestions for information that should or should not be included, please include comments.

INFORMATION NEEDED (100% complete will only be accepted):
State:
Closest City/Town:
County:
Grid Coordinates: (mine is EM58BN)
[take a look at Buckmaster { http://www.buck.com/cgi-bin/do_hamcall }]

Lat/Lon of Repeater: (mine is -89.8511 lat 38.5501 lon) {This Is Important!})
        [take a look at Buckmaster { http://www.buck.com/cgi-bin/do_hamcall }]
Frequency Output:
Frequency Input:
Frequency 1 Linked: (submit all information about this frequency)
Frequency 2 Linked: (submit all information about this frequency)
Frequency 3 Linked: (submit all information about this frequency)
Repeater Call:
Repeater Owner/Trustee Call:
Sponsor:
Repeater Features: (LiTZ, Open, Autopatch, PL Tone {CTCSS}, Digital Tone, etc.)
Power Output:
Type Controller/Repeater:
Antenna Height Above Ground:
Antenna Height Above Sea Level:
Antenna Gain in dB:

OPTIONAL INFORMATION:
Repeater Owner/Sponsor email: (only one address)
Repeater Owner/Sponsor homepage: (only one address)
Repeater Owner/Sponsor US mailing address: (not email or homepage)

The digital frequency diplay of my FT107 has lost some segments, due to
a partially defective counter chip.
Does anybody has this counter chip, or info how to obtain this chip.
The LSI counter chip is called MSM9520RS.
This one is also used in the FT707. Yaesu has no stock left.
Best regards and hope to hear from you...Gerard PA2GBK

Yes we also tried to get this part for a repair but were told by Japan
that no more stocks were available.

Try asking for a non working FT707 or 107

Fax or Email Japan and ask them where they come from, They often will
send you one for free.
Don't believe everything the agents tell you as I have had a similar
problem some years ago.

Whilst on this anyone know of a source of the multi-pin miniture Jack
plug as used on the FT10-50R handhelds?
Happy New year to everyone.

The part mentioned looks like an OKI Semiconductor part from the number
-- should be possible to obtain this part from an OKI distributor -- but
very often parts are obsoleted and nobody has any stock left....
```

Regards..

A couple of years ago I was trying to locate a source of a very
similar device which was used in (I think) a Lowes SRX-30 HF
receiver. I tried all the usual OKI distributors in the UK,
including OKI themselves who fax'ed Japan for me, as well as
Lowes and Yaesu who both 'thought' they had some, all to no
avail. From what I recall being told by OKI, the various
equipment manufacturers all had different versions of the chip
mask-programmed to their specific requirements (IF offsets,
etc), so once the supply of a particular variant was exhausted,

that was it - finito, etc. They did offer to make a new batch for me, but wanted a minimum order of (IIRC) 10,000!

Sorry to be such a kill-joy, but I don't hold out much hope that you'll be able to find a supplier. Good luck with your search, anyway.

radio.swap,rec.ham-radio,rec.radio.amateur.swap
```

OK, here's the deal. I have an IBM ThinkPad 720 mono that is collecting dust.

The package I have includes: laptop (486/50, 12/240, all ext. ports, 1.44 floppy, 2 PCMCIA slots), AC adaptor/charger, 3 extra batteries, 2 extra 160mb hard drives, 2 docking stations (both with full set of ports, SCSI-2, 2 expansion slots, 5 1/4" drive bay. One has 2x IBM SCSI CD-ROM.), external battery charger, and hardshell carry case with handles and wheels. Everything

is in excellent condition. Current value on today's used market is about $1200 for everything. Would prefer to keep package together, buyer pays shipping.

What I would be willing to trade for: cash, BC 9000xlt, 2m/70cm handheld, AOR

AR8000, PRO26, PRO2006, BC 3000XLT, Icom R7000, digital general coverage receiver, and
possibly other items. Will accept combination of above or other arrangement to equal value of laptop and accessories.

Please email offers and questions. Thanks.

Someone else asked for this too so I'll post to the newsgroup.
There is a bandplan available on the web at the University of
Texas Amateur Radio Club site, http://www.utexas.edu/students/utarc/
Look for a icon that mentions band plans.

BTW, I'm posting this from a friend's account. If you have any questions
you can reach me at barron@liant.com.

```

The 1997 Orlando HamCation (SM) and Computer Show, sponsored by the Orlando Amateur Radio Club, will be held on February 14, 15 and 16, in Orlando, Florida. The Orlando HamCation is the second largest hamfest in the southeastern U.S. with over 400 swap tables, 150+ commercial exhibitors and the largest tailgate area in the southeast. We will have many interesting and exciting forums/seminars/workshops. In addition, the programmers and experts in APRSdos, WinAPRS, MacAPRS and JavAPRS will be present to answer your questions.

For further information about the Orlando HamCation, please visit the Orlando Amateur Radio Club's home page at:
http://www.cycat.com/users/oarc
or go directly to the HamCation URL at:
http://www.cycat.com/users/oarc/hamcat.htm

We hope to see you here in sunny Florida and that you will enjoy the Orlando HamCation!

I have the folling to sell as a package:
1- ICOM ICW21A (Dual Band Handheld)
Will recieve from 50mhz-999mhz
5watt,Dual Band, Battery Pack
1- ICOM SpeakerMike - W/DTMF Pad
1- ICOM Spare Battery Pack (W/Microphone in Battery)
1- ICOM/KENDOO Rapid Charger (1 Hour)
1- ICOM Case for Radio
1- 35Watt Amp/PreAMP

I have the original boxes and all the manuals. This unit is in perfect shape.

Would make a great mobile rig (giving you 35 watts of output).

$250.00 takes it all including shipping.

If you have any of these items around and would consider an offer to sell, I would appreciate hearing back or if you know of a person or person with such items.

RCA BA-a or BA-86 A broadcast Limiter (circa 40's-50's)
Pulse Technology Equalizer EQP-1 (60's,70's)
Teletronix's Levelling Amplifier LA-2a (60's)
Universal Audio/Urei Peak Limiter 1176,1178 (70's)

I would very much like to locate any of the above items and
look forward to any word back
Ken at   gold@nucleus.com

I am in need of a IC for a Motorola Moxy 150 Mhz radio. I have contacted the Motorola service rep. in my area and I keep getting the runaround each time I speak to them. I have been trying since May of last year to get this IC and usually I hear that "I'm sorry we forgot to order it for you" or "I lost the numbers you gave me". If someone has the ability to order this for me please let me know.

It is the desc. IC with the following numbers on it "M2078" and "274 H 8436". I have tried to cross this to another number but have had no sucess.

Please do not take me wrong I am not bashing Motorola, just tried of not geting the part that I needed.

newsgroups: rec.radio.scanner,rec.ham-radio,rec.radio.amateur,rec.radio.amateur.misc,alt.radio.scanner
x-mailer: Mozilla 3.0 (Win95; I)

Now available! Take a look!

WinTone32 v1.5 - Real Time DTMF Decoder/Scanner Monitor for Windows 95/NT

Works with your windows sound card to detect DTMF tones, no other hardware
required! Here is a list of the (new) options:

* Tunable Detection Options - Everything from changing sensitivity to logging
  tones to file - You control it all.

* Log tones to a file for later study.

* Decodes DTMF tones in real time by using your Windows compatible sound
  card and any audio source hooked up to the Microphone jack.

* Decodes DTMF tones from windows WAV files

* Optionally saves audio into a WAV file

* Scanner Monitoring - Allows you to record audio to a WAV file, but
only
  when the audio breaks the software "Squelch Point".

* DTMF Triggers - Assign events to certian DTMF tones, and when these
tones
  are detected, the events cause pre-defined actions (Launch an EXE,
Start
  recording to a WAV file, Etc)

Here is a list of the stuff that I will have for sale at the Charlotte Hamfest. If you want to get an advance look at it or buy it before the hamfest give me a call. Better yet send your phone number over E Mail and I will give you a call.

1. Collins Thirty S-One amplifier. 100 watts in produces 1300 watts out. Uses 4CX-1000 tube. In like new condition with manual. $975 - very firm

2. Complete B&W slow scan setup. Robot 400 slow scan, Sanyo monitor and RCA camera. All of it like new with manual. $275

3. Kenwood TS711-A all mode 2 meter transciever. Memories, SSB, funky offsets, this unit has it all. Just like new with manual. $525 - don't even ask

4. Go into business with your own computer to program cellular phones. Loader phone, computer with software installed and operating, cables for motorola bagphones and installed phones, diagrams to make cables for all other motorola phones up to software version 95xx. This setup really does work, and I will give instruction in how to use it. You can get your money back in one saturday at the flea market.
$850

5. CD ROM drive with interface card and sorftware. Works perfectly
$25

6. Star printer. Works perfectly, missing one piece of plastic.
$25

7. Okidata microline printer. Works great.
$10

8. Calcomp plotter, "E" size. Hangs on serial port, works perfectly. With manual (which cost me $130) and serial connection. Emulates HP plotter. $200

9. IBM Selectric typewriter. Works fine, great for filling in forms.
$25

10. Modems - 1200 baud and 2400 baud. One US Robotics and One Hayes internal.

$10 each

11. Orchid Videola Premium Plus. Complete and working fine. Video capture and playback on you PC.
$175

12. PK-323 MBX. Just like new.
$175

Hi,

Can anyone tell how to use the "zipped ckt & reprot file"s in
http://www.arrl.org/ard/files/ ?
I downloaded a file exrf9507.zip which contaians two files. one is some kind
of a data file (like pspice) & the other one is unidentified. I can't read/use
them properly. Can anyone help?
Btw, What is ARD, is it a magazine or a software?

Thanks in advance.

ARD is the ARRL Radio Software. You will see it advertized in QST and
QEX in most issues over the last 2 years. The files you downloaded are
likely ones for the analysis of circuits using ARD.

Looking for something cheap. Dual-band would be nice. Must support CTCSS
and PL tones.

Remember, I'm a college student.... I can't afford much

thanks,
Dan

I am not familiar with the HR2510, but with my archaic equipment, this type
of activity can be evened out by reducing the RF Gain (for Strong stations)
and then controlling the output to the speakers with the AF Gain. This
keeps the delayed AGC from saturating like that ... KB4EG

> -ronmyers@juno.comHi again,

As the originator of this thread, (request for help) I should clarify one
point.
I realize that when a radio is on SSB the s-meter only responds when it is
receiving a
signal and not between sounds as opposed to an AM carrier which shows an s-meter
reading
at the keying of the mike. Let me put my problem in perspective: If a person were

to key their mike on SSB while I was monitoring and they also emitted a steady tone into their mike, my s-meter would first show high and then after approximately one second take a dive as would the audio level of the received signal. The received signal is never attenuated to a point where I cannot hear it, but it almost seems like the radio is attempting to take all received signals and keeping them at the same level so a multiple party QSO would not have varying levels of audio. I know of others that have the same thing happening with their rigs. I just thought someone would be able to tell me why this was happening and if there is a mod for correcting it. It's not that big of a problem, but I wouldn't mind having the signal come through at full force. When someone asks for a signal report, I have to tell them that when they first transmit, they are s-7 and quickly go down to an s-2.

Please help me find a source for a manual/schematics for an old Allied
model A2516 ham receiver. It is an older tube type, a kit I think.
I have tried Sam's and Sarrio with no luck. Does anyone know some good
sources for manuals or possibly an individual that would have a xerox

copy available? Please forgive me if this is in an FAQ somewhere,
I am a newbie, and this is my first "taste of ham" :)

p.s. I'm hooked..........

Thank you ALOT!

I am restoring some radios but have problems with repairing the aluminum coating.

Does anyone know what this clear, kind of yellow finish is that you see on most aluminum equipment chassis, and on aluminum antennas?

I don't think it is anodized, it looks like the aluminum parts are dipped in something, because you can still see the "drips" in the yellow coating.

Does any-one know that this "something" is that these parts are dipped in?

Thanks,

Loek   LDHONT@ti.com

It sounds like the aluminum has been treated with alodine. Alodine makes aluminum corrosion resistant. When I did my 90 days painting navy aircraft, we applied it to bare aluminum with a sponge tipped applicator and washed it off with water when the metal had turned the proper color. It is also used on some of the mil spec electronics I work with.

We still use alodine in the aircraft industry. The stuff we use is a dry powder that we
dissolve in water. We apply the resulting solution per your description. It protects the
aluminum from corrosion, and it's electrically conductive. The alodine powder and
solution react explosively with methyl-ethyl ketone.

I think zinc chromate used to be used. I'm not sure if it is still available or has been replaced by something "better."

Most of the pictures sent by the helicoptors is on microwave. They use a fairly directional system on the helicoptor which actually tracks the mountain top receiver.

I believe it is in the 2GHZ area.

Unless you are between the two, chances are not favorable you would see anything.

You could call Troll systems, in Valencia CA and ask. They make the xmitter systems.

"Loek d'Hont" <ldhont@ti.com> shared these priceless pearls of wisdom:
->I am restoring some radios but have problems with repairing the aluminum
->coating.

What you are looking at is the chromate version of Alodine. Alodine is an aluminum chemical film corrosion inhibitor and is really quite excellent. Most well-stocked automotive paint stores (not the handyman stores) have alodine.

I would suggest that you get a bottle of Metl-Prep while you are there. It is a alkaline etch for the aluminum that strips the old corroded aluminum surface down to the bare clean metal. THEN Alodine it and it is good for a long time. Watch out, the stuff will turn you into a girl if you spill it on the wrong spot.

Be VERY CAREFUL with the Alodine. There have been some credible reports that it is a decent carcinogen. Then again, the same is said of filet mignon.

If the paint stores don't have it, the aircraft parts houses certainly have it. We couldn't live without it in the flying game. By the way, if you have the option to use stainless steel hardware with the chassis, it will cut WAY down on that "powder white" corrosion that you see.

It's a major hazard, as far as our safety people are concerned, and I'm frankly surprised it's available retail. Handle it with great care.

It does work well, though, which is why its corrosive and carcinogenic properties are tolerated.

Has anyone used Zinc-Chromate for this purpose...used to be available
at most Automotive Supply stores...rather expensive, though.

Hah, my wife is happy when I'm playing with the radio, or the computer. At
least she KNOWS I'm not with another woman, which I might well be in someones
case.

Bill

I just purchased a working Cushman CE5 Monitor. The deviation scope and 450 plug works well but 25 meg and 150 meg plugins are not doing well. Also the A17 PPL board is hosed. I need some help in resurrectiong this vintage piece of FM test gear.

If anyone can point me toward any commercial outfits that might still support this monitor or better might have parts, manuals, and/or plugins, I'd be most greatful.

Followup directed to: rec.radio.amateur.equipment but email CC would be appreciated.

I missed the beginning of this thread, so I hope I'm on track. If you are trying to repair a surface that was black anodized, on alulminum, of course, I purhase a little bottle from gun stores, made for blacking aluminum, called "aluminum black". You degrease the surface, and apply sequencial amounts, with a cotton swap, etc. After a few minutes, the surface turns to a dull black. Not as good as anodizing, but at least you can do it at home.

I think the manufacturer is "Birchwood Casey". You might also try some
sporting goods supplys.

Too light for a boatanchor. Add a few bricks.
That's the main problem with all this newfangled equipment. Too light.
And too small, too! I believe they should charge by the pound for radio
equipment. Much more equitable.

I am thinking about buying a scanner (probably an AOR AR1000 or other low-end AOR, or maybe one of the more expensive ones, if I think it will be worth it) to listen in on police and cellular phones.

I am in Australia.

I am wondering about the system used by police between the cars and the base to communicate. While in a police car once (don't ask), I got the impression that the base could speak to any car directly, without the other cars hearing their transmissions. How would I listen in on all the cars, if this is the case?

Also, it seems that the cellular frequencies are often disabled on these scanners. How do I un-disable them? I am handy with a soldering iron, but not-so handy with anything to do with RF.

Thanks in advance.....

> Thanks in advance.....As far as only being able to talk to one at a time, generally they use
different channels or the patrolman's receiver could be actuated when it
receives a particular subaudible tone from base and only those with that
tone programmed in would receive the message. A scanner wouldn't care
about the tones so you would receive everything.

MJane!

I've never considered it, but now that you've mentioned it, WOW!...

This evening after my long commute to and from work, I'm taking a chisel and hammer to my SIX BOSE SPEAKERS, located ALL AROUND ME, in front of me, next to me in the door panels and rest assured, I won't forget that pair BEHIND me either! They all must go!

Monday I am mounting a expedition, I want you to be in charge, to both the North Pole and South to dig-up those damned BIG MAGNETS the DEMOCRATS burried lo those many years ago, used to keep all races POLARIZED!

Our plan is to MOVE those magnets to the Moon. Now, here on Earth, one simply tosses a empty can into the air and Zap!, the can is on it's way to a crater and half of our ecology problem is solved!

MJane, please don't forget the MAGNETS on your REFRIGERATOR DOOR because they were placed there to 'get' your FOOD! 'Oh Damned!... The MICROWAVE's gotta' go too! No Microwaves without a HUGE MAGNET!

Be advised, our next Newsletter reveals that DENTISTS are part of 'the plan' too! Dentists have placed tons of SILVER fillings in our heads, because it's a well known fact that Silver is one of the BEST CONDUCTORS in the World(!)... thus assuring each of us would RECEIVE "MAXIMUM MAGNETIC PULL" ("MMP") right UP to our BRAINS, 24-hours a day! ARGGGG!

Warn everyone now! Don't go to any more LARGE STORES either! They exposing our BODIES to known QUANTITIES of PHOTONS, measured at MICROWAVES(!), all part of 'the evil ploy' and cleverly disguised as: AUTOMATIC DOOR OPENERS! But the trick is, if you must go, Let someone YOU DON'T LIKE go in first! You RUSH in - BEFORE the door closes.

MJane, these are all FACTS, each proven by utilizing the well known method where we place our arms out even with the horizon and spin round-and-round-and-round, until we actually CANCEL the evil Magnetic Influence by spinning FASTER than the Gravitational Pull! Very similar to the PULL I am placing on your leg now. Notice when one STOPS how everything now MOVES on it's own? This is how life REALLY IS, but soon, the magnets will all have their way.

Your Uncle T.
WA6IGJ

As far as recieving from the helecopters, first thing you have to find out what frequency band they are operating in. Usually they are near the MDS (1900-2200 MHz), or they may be in the 7GHz band. They may either have syncronous antennas which track the recieving site or they may run omni and the recieving site tracks the transmitted signal. Their power is usually under 15 watts, and being microwave it IS line of sight. The video modulation is FM as are the audio carriers, usually 6.2 and 6.8 MHz, some have special subcarriers for other data. Basiclly they use the same equipment as the ENG trucks on the street and have to share the same 2 bands with them.

It doesn't have to be an either/or thing. . .
Put the ham gear in storage until you decide to leave.

lol....and don't forget to wear the lead lined vest and welders mask while reading this message at the
computer, unless you want to let the monitor's radiation convert your body into a giant sized burrito!

I took out the left side speakers the other day, and damned if the car didn't start pulling to the right!

KuoH

I assume that you want some sort of comprehensive listing as opposed to trying to gather dozens of old sectionals (by visiting airports across the country) and transcribing info from the sectional to some kind of database.

Almost all of the lower-end flight planning programs I've seen access a simple ASCII file for lat/lon info on VORs and airports. If I were doing a program I would just take one of these files and use it for my reference file. NAV4 is one such program, and you should be able to grab that at any aviation site or in the aviation forum on CompuServe. Just for grins, I might try the FAA's web site because there are several databases there and you might get lucky.

Good luck.

Does any-one know a source for Collins mechanical filter?

I am looking for a 450 kHz LSB filter from the Collins "FA" series
(the narrow one is preferred but 4 Khz is also OK)

Thanks,

Loek d'Hont   LDHONT@ti.com

You should try asking on the various ham/amateur groups, as well as rec.radio.shortwave. There's sure to be people on there who will know of sources of Collins parts. Many amateurs and shortwave listeners still use Collins gear such as the R390, 51S1 and "S Line" ham gear.

I have an Icom IC-R71A Short-wave receiver for sale with matching Icom IC-SP3 external speaker and Icom RC-11 remote control. I am also including the Autek research QF1A SSB/CW/AM filter.

Condition of this RC71A is exceptional. No Blemishes scratches etc. Speaker and peripherals are like new including the QF1A from Autek research.

The Icom IC-R71A covers 100Khz-30 Mhz
100Db of dynamic range

Passband Tuning
Adjustable notch filter
Level and pulse width
Selectable noise blanker
Selectable AGC
Filter switches
Keyboard frequency entry
SSb--AM--CW--RTTY and optional FM
32 memory channels
optional CW narrow filters

The Package price is $775.00 Transaction via UPS COD. {Free shipping UPS COD via UPS regular to CONUS}
Package only it is not being broken up.

Mark

I have a set Vol 1 & 2 of Canadian Air Force Signal Training Manuals
that were used to train Radio/Radar Techs in WW2. Covers are in poor
condition... all pages intact... and handwritten notes throughout.

Very detailed treatment of electromagnetic theory, Field Theory,
AC Circuits, Tubes, Oscillators, Receivers, Transmitters, Antennas,
Wireless Transmission Phenomena, Direction Finding,
Batteries & Power Supplies

$10 O.B.O. + Shipping if required

I have a pair of 6146B Final tubes for sale. Worked fine when removed from service. I no longer own the transmitter they came from, so the tubes are for sale.

$18US + shipping.

-- Hi, Can any of you help me? I spent 6 years in the US Navy and got most of the NEET series books.   I need the following Navy Electricity and Electronics Training Series (NEET) manuals to complete my "library" of my navy reference books.......Thankyou in advance for your assistance/help in this matter...

Module 2 Introduction to Alternating Current and Transformers
Module 9 Introduction to Wave-Generation and Wave-Shaping Circuits
Module 10 Introduction to Wave Propogation, Transmission Lines, and Antennas
Module 15 Principles of Synchros, Servos, and Gyros
Module 16 Introduction to Test Equipment
Module 20 Master Glossary and Index
Module 21 Test Methods and Practices

Thanks again and 73.......
Jerry Moore / AE4PB..........

PRESS RELEASE

Visit http://www.gosupersonic.com to download a fully functional trial version of SuperSonic.
SuperSonic v2.01 is a very poweful and very inexpensive alternative to expensive radio hardware. It can be used to create attended and fully unattended complex audio feeds.
Beta tested on Eagle Radio Networks, SuperSonic is a powerful tool for radio broadcasters, internet audio broadcasters, and amateur/pro disc jockeys.

<Picture>

<Picture>***Road Trip To Dayton***<Picture>

The SCARS club is planning a trip to the May 1997 Dayton Hamvention and you can be a part of it (you don't have to be a club member to go).

The trip will include a chartered bus from the Fort Mill / Charlotte area to Dayton, accomodations at Dayton University for 3 nights (May 15th through the 18th), and the hamfest ticket all for only $162.00 !!!

Thats right, you've often heard of the worlds largest hamfest and now you can be a part of all the action, but, you need to respond quickly as we are limited in the number of people that can go so if you are interested, fill out the form below and a member of our club will contact you with all the details.

Just Announced!!!!

The SCARS club will be holding a raffle for 2 complete packages as mentioned above to the Dayton Hamfest as well as $150 in spending cash (or the cash equivalent for non-hams). This raffle is limited to 200 tickets at only $5 each. If you are interested in purchasing a ticket (these will go fast !!!), send e-mail to Jerry Moore (AE4PB) vigilant@cetlink.net

See You In Dayton !!!!!

I have the following Ham Gear FOR SALE....

Kenwood TS-450AT w/ narrow SB Filter and Heil Desk Mic. It's in Mint Condition and works fine. Price: $ 750.00 + shipping

Nye Viking Roller Inductor Tuner Model MB-V-A . Great Shape & Works Fine. Price: $ 400.00 + shipping

Henry 2k-4 Console Amp. Has new transformer. Works Great and Looks just as good. Because of size this is pickup only.... Price: $ 750.00

Reason for selling is that I just got married a few months ago and either the Ham Gear or me go.

Make all replys to:

farmboy@rollanet.org

Thanks for reading....

Jim

'Married' and 'unwisely' in the same sentence is redundant....

organization: quantex
newsgroups: rec.ham-radio,rec.ham-radio.packet,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.shortwave,rec.radio.swap

Hello, I am considering to buy a PACTORII unit from SCS GBMH, the PTC-2

See for more information:

http://www.scs-ptc.com/pactor2.html

From this URL I got my information, what I am trying to figure out is if it is really is the very robust digital communication method that they claim it to be, or if it is just another sales pitch.

After all, $900+ bucks is not cheap.

Is there any-one out there that has bought this TNC? What are the experiences?

What are the chances that pactor-II might be licensed out to other manufacturers TNCs like AEA?

Thanks,

Loek d'Hont   ldhont@ti.com

When I am receiving a signal on SSB on my HR2510, the s-meter first goes high and quickly goes down as does the audio. I believe this is caused by the agc circuit. Is there a way to eliminate this from the radio or at least limit the amount of attenuation? Any info would be appreciated.

Well, I dunno about you, but I don't know if I can _live_ without one of
those South-African wind-up radios! 'Course, you can probably get them
for $52.98 in some ad in _Popular Communications_ rather than C. Crane's
$99.95, but still...what a cool product.

Apropos of this, has anyone ever heard of the Soviet fuel driven
shortwave receivers produced in the 'fifties or 'sixties? I have been
trying to track down more on these for several years.

I remember seeing a picture of one in action. It involved a
thermoelectric generator affixed to the chimney of a kerosene lamp-- the
generator was the thing, it worked with any number of low-power radios.

You may have a defective AGC. Or there may be some other problem. Does
the radio work ok on AM?

not tramsmit a carrier wave, so your radio is working properly.
This has nothing to do with the AGC circuit. If you are not recieving a
carrier wave quite naturally the S-meter would reflect this by not
indicating a signal during the intermitant periods of silence typical to
audio communications.

Leo, there are some AGC mods at www.qrz.com. The stock AGC for the
HR2510 is pretty slow to react but that can be fixed if you want to.

Actually Artie cooked up the idea for a SW broadcast BEFORE consulting
TRN/CBC, as such they have refused to bank the project.

On SSB there is no carrier so to speak. The carrier is only there when the
other fellow talks and it follows the audio . If the other fellow says
```

```
nothing there will be no carrier going out and you will see no signal coming
in. If he speaks loud then lots of carrier will go out. That is the way the
SSB works. I don't think there is anything wrong with your radio.

duh W.W. doesn't have a clue. Sounds like a defective AGC to me. I'm really not
familiar with the 2510, but many radios that have both AM and SSB modes use two
different AGC time constants. One for each mode. The attack times are similar
but the AM AGC typically has a much slower recovery (or hang) time. Sounds like
your radio is not switching between the AM time constant and the SSB one. If
you're handy with schematics and have a scope or even a voltmeter you should be
able to find the time constant switches and trouble-shoot the problem..

No! SSB transmissions have no carrier as AM has so when there is no signal;
s meter drops down, as well as varing in value during the reception of of a
transmission. Thats the way it is.

Sounds like she's got to go!:-)))

Actually try using my line " At least I'm home and you know what(and
whom )I'm doing! and always remember the alternative is that I could be
OUT "  and leave out to her imagination !

John

V 0.5 Beta - Release Notes

21 June, 1996

Problems installing RadCad-Lite

Some users have reported problems with Setup.exe.

On running Setup.exe, a message is displayed say 'Cannot copy VBRUN300.DLL'. This occurs when there is already a copy of VBRUN300.DLL in the WINDOW\SYSTEM directory. The fault would appear to lie with Setup.exe, supplied by MicroSoft as part of the Visual Basic 3.0 setup kit. Setup.exe is supposed to install VBRUN300.DLL included with RadCad-Lite, provided the copy of VBRUN300.DLL on the target system is older than the version about to be installed. This is not happening.

If you are experiencing the above problem then we suggest you rename your current version of VBRUN300.DLL and then run Setup.exe again. Check that any other applications that require VBRUN300 run correctly.

We are working on this problem and will post an advisory note to usenet.

The version data for the version of VBRUN300.DLL included with RadCad-Lite is:

Size: 394,384 bytes
Date: 28 March, 1993

Why the heck are RF power transistors so darn expensive!!!

Is there any cheap Asian source or cross for some of the popular
motorola MRF types?? Or the European BLU, BLX BLV types??

I need a high volume source and a good price!!!!

Well, what may be high cost may really be dealer markup. Log onto
Motorola's web page and do a price lookup on some of the transistors you
are looking for. Most of the prices are in 20 piece increments but if you
are looking for a lot, or want to do a bulk buy with someone else, 20
isn't a lot. BTW, you also need to haggle with Motorola distributors for
a better prices, at least ask them to match what Motorola says they should
cost.

Because they keep burning out, and you are only buying a small quantity!!

: Is there any cheap Asian source or cross for some of the popular
: motorola MRF types?? Or the European BLU, BLX BLV types??

We need an xref for those european types, I guess.

: I need a high volume source and a good price!!!!

Try http://www.digikey.com or www.mouser.com.

Dear Terry,

I'm an applications engineer at Ericsson Components, RF-power products in Sweden. We have a broad range of RF-power transistors for various applications but mostly in cellular radio frequencies. We are one of the biggest suppliers in the world for these kinds of transistors and I believe I can say that we always have better pricing than Motorola.

You are welcome to come back to us for more information. You can either contact me or maybe even more convenient for you is to contact our headquarter in Morgan Hill, California; +1 408 778 9434. Ask for Harold Barmore, sales manager or Larry Leighton, engineering manager.

See also www.ericsson.se/EPI/BK/Access/rftran.html for some product info.

Kind regards // Ulf Persson +46 8 404 6199

Hi,

I am a lonely Mac user in SWL-world and I am wondering whether there is a good probagation prediction program for Macs.

I know MacShortwave, but it doesn't suit all my needs and crashes occasional.

Any suggestions?

P.S.: Is there any source-code for this task? I could try to port it to Mac if I find something good...

Check out the various shareware Mac radio related programs I have up on my web page, the URL is http://www.access.digex.net/~cps/sss.html. One is MacProp, a propagation forecaster.

Chris

Where can i find a mobile antenna base that will easily swing down 90 degrees
to lie flat along the roof?

I want to mount it outside the drivers window, on the gutter or roof, and be
able to reach out the window to lay the antenna flat as necessary.

I am sure i have seen something like this. It was some kind of ball-joint
with detents at 90 deg. to hold the antenna in place.

It should be able to hold a standard 5/8 wave 2-m antenna.

I need to get this soon for an upcoming road trip. Thanks much for any help
in finding this antenna.

I have a pair of 6146B Final tubes for sale.  Worked fine when removed
from service.  I no longer own the transmitter they came from, so the
tubes are for sale.

$20US + shipping.

I'm wondering if anyone knows how to get through the firewall of a
Toyota 4-Runner? I want to run both 12 volts and coax thru for 2
meters. I have an on-glass antenna now, and ran 12 volts to the
fusebox, but this is temporary. I want to mount an antenna on the side
of the hood.

Thanks...Don - KD1EU

Remove the front passenger interior kickplate. Remove the computer. Above and
forward of the computer is a large (2.5-3") rubber gromet.
Put a slit in the gromet and feed away. I run vhf (50w) and uhf (35w) with no
computer problems.

by the driver and passenger seats.

Look under the car for these. They are black and look like
freeze plug punch outs. I ran my power cables that way up
through some "channels" in the frame and right to the battery.

> I have done this on a 1992 and currently have on my 1995.

I really had trouble finding that hole in the wall that was
mentioned on here at the time I installed my radio.

I put a Kenwood 742 remote unit in the little cubby holes in
the very back, ran the cable/control/power up to the
back passenger seats. Ran the power through the floor, and
the control cables up the console area.

Worked out pretty well.

I need to install through the roof antennas now. Havn't taken
off the head liner, that might be a huge task? ANYONE DONE IT?

I do know better than to drill the holes in the roof right
on the cross-beams. I have seen people make that mistake before.

I have a pair of 6146B Final tubes for sale. Worked fine when removed from service. I no longer own the transmitter they came from, so the tubes are for sale.

$18US + shipping.

In my '93, there's a rubber booted wire bundle running through the firewall in the
upper right
corner of the firewall. I ran 8 GA power straight back from the battery to a DC
power outlet
box just below the glovebox.

Hello I'm intersted in purchasing microphones of all nature.
Models by RCA,Western Electric,Neumann,AKG,Shure,Electro-Voice,American,
Telefunken,Altec,Sony,Turner,Astatic, etc.
Check the cupboards,ascend into the attic,ask your neighbors and
get back to me for I'm waiting with a hot chequebook.
Thanks

I have mounted an antenna on the back corners of the roof. Since
I have the sunroof and the roof rack, that was the only place left!
They have worked out well and perform very well at those locations
(440 and 6m). There is just enough room for a mount there, which is
accessible when you remove the back plastic cover along the top of
the rear window. You can then run your coax along the sides of the
headliner.

Be sure to buy antennas that fold over (like Comet) if you plan on
entering any parking garages...;-)

I have a set Vol 1 & 2 of Canadian Air Force Signal Training Manuals that were used to train Radio/Radar Techs in WW2. Covers are in poor condition... all pages intact... and handwritten notes throughout.

Very detailed treatment of electromagnetic theory, Field Theory,
AC Circuits, Tubes, Oscillators, Receivers, Transmitters, Antennas,
Wireless Transmission Phenomena, Direction Finding,
Batteries & Power Supplies

I am looking for a set of knobs for a 600-series Zenith Trans-Oceanic radio. The ones I have have lost all the gold paint, and I need a new set. The ON-OFF knob has a small flag that covers the "ON" indicator when the set is off.

Any help appreciated.

Thanks,

Bobby

and it will be as though there is light before you. We found the message below and decided to have some fun and try it. We have never looked back. You try it too and have as much fun as we have and earn some money too. Read on and enjoy:

I saw an article in an internet newsgroup telling me I could make $50,000 within a month for an investment of only $5.

I thought it was a huge joke. I spoke to my wife, attorney and friends about it, and they all agreed it was some kind of scam. I can't stand scams, because usually someone gets burned, and I didn't want it to be me. Of course, I rejected the idea at first. After a short period of about two weeks, I thought: "I have already heard of such things. But on the Internet?!?!?". I decided that even if I had to throw $5 into the fire, I wouldn't mind it that much, and gave it a try. After all I needed a LOT more than five dollars.

Two weeks later, I began receiving money in the mail! I could not believe it! Soon, hundreds, and then thousands of dollars began to roll in. Within 4 weeks, I had received a total of $32,445! It came from everywhere in the world. My bank account has changed its "-" into a big "+" (++++)!!!, I bought myself a car and things I wanted for a long time for my wife and kids!

If you follow the three steps below, there is no reason why the same shouldn't happen to you! This is a legitimate investment opportunity. You invest $5, and you receive a return on your investment. So does the next investor. NOT ILLEGAL, NOT A CHAIN LETTER - PERFECTLY LEGITIMATE.

If you are not interested, then don't participate, but please print this article and pass it on to someone who may be interested, so they can take advantage.

The procedure is simple: 1) Write your name and address on 5 sheets of paper. Below that, write the words, "Please add me to your mailing list." Fold $1 note or bank draft or money order in each piece of paper and mail them to the following 5 addresses:

1. Olivier Aracipane
    237 rue Francois Andre
    7390 Quaregnon BELGIUM

2. Josef Malzer
    Brandhof 1
    4701 Bad Schallerbach
    EUROPE - AUSTRIA

3. Jeff Durham
    RR3 Box 263-E
    Mt. Vernon, KY 40456

4. Mac Johnson
    30556 Mira Loma Drive
    Temecula, CA 92592 USA

5. Nora Hanna
    Comp. 147, Site 20, RR1
    Whitehorse, YUKON
    Y1A 4Z6 CANADA

2) Now remove the top name from the list, and move the other four names up. In other words, #5 becomes #4 and so on. Put your name as the fifth one on the list. Use a simple text editor such as Notepad, in your

"accessories" window (If you have MS-Windows), or DOS editor. In fact, any editor will do.

3) Post the article to at least 200 newsgroups. There are 17,000, so it shouldn't be hard to find that many. Try posting to as may newsgroups as you can, and the bigger the newsgroup is, the more people are to see your message!

You are now in the mail order investment business, and should start seeing returns within a week or two. Of course, the more newsgroups you post to, the greater your return is. If you wish to remain anonymous, you may use a pseudonym, call yourself "The Manager", "The Boss", whatever but make sure your address is correct.

Now, here is why the system works:

-Of every 200 posts I made, I received 5 responses. Yes, only 5. You make $5 for every 200 posts with your name at #5.

-Each person who sent you $1 now also makes 200 additional posting with your name at #4. i.e. 1000 postings. On average therefore, 50 people will send you $1 with your name at #4. $50.

-Your 50 new agents made 200 postings each with your name at #3 or 10,000 postings. Average return 500 people = $500. They make 200 postings each with your name at #2 = 100,000 postings = 5000 return at $1 each = $5000.

-Finally, 5,000 people made 200 postings with your name at #1 and you get a return of $50,000 before your name drops off the list. AND THAT'S IF EVERYONE DOWN THE LINE MAKES 200 POSTINGS! Total income in one cycle = $55,000.

From time to time, when you see your name no longer on the list, you take the latest posting that appears in the newsgroups, and send out another $5, and put your name at #5, and start posting again. Remember, 200 postings is only a guideline, the more you post, the greater the return.

Lets review why you should do this. THE ONLY COST IS $5, AND 5 STAMPS, AND 5 ENVELOPES. Anyone can afford $5 for such an effortless investment with such SPECTACULAR RETURNS.

Some people have said to me, "what happens if the scheme is played out and no one sends me any money? "Big Deal, so you lose $5-but what are the chances of that happening?? Do you realize that NOBODY cares for the LEGAL chance of winning such BIG money as 50,000 $$$$???? and all for a microscopic investment of five separate dollars? Just think of all of the new Internet users that join the net every day!!!

There are millions of internet users, and millions of new net surfers every month!!! This is the great plus of the Internet, people all over the world can hear you and listen carefully if you talk reasonably. Everyone will take that chance! I agree, if it wasn't the Internet, and was a small circle of people, the chance wouldn't have been so small. The amount of money had to be 200 times bigger, and the chances were zero. It wouldn't succeed.

But here, on the Internet, it is a giant village, where new thousands of members join in every day! You CAN'T lose!!!

Remember-read the instructions carefully, and play fairly. That's the only way this will work. Get a printout so you can refer back to this article easily.

Try to keep a list of everyone that sends you money and always keep an eye on the postings to make sure everyone is playing fairly. You know where your name should be.

REMEMBER-HONESTY IS THE BEST POLICY. YOU DO NOT NEED TO CHEAT THIS IDEA TO MAKE MONEY!! BESIDES, NOT PLAYING THE GAME FAIRLY IS ILLEGAL. SO LET'S BE REASONABLE AND PLAY FAIRLY, SO WE CAN ALL ENJOY THE INTERNET GOLD MINE.

GOOD LUCK FOR YOU ALL, And remember, play fair and you'll win, I don't want to mention what might happen to those who won't. AND AGAIN, SEE YOU NEXT TIME WITH SOMETHING YOU WANTED FOR A LONG TIME!!!

It is reading posts like this that make you look forward to your day every morning and nothing else
enriches your life as much as all this valuable, unique information filled with original ideas that
are bound to augment your life and bring it as close to perfection as possible. In other words,
stop cross-posting this shit. Everyone has seen this many times already and no one is gonna fall
for any of these so-called "commercials".

I sorry too hear the story about the police radio jamming.. I am alos a
police officer in the U.S. but  I  did not see where the article cleared
showed a amateur radio operatorwas the person doing the jamming. If you
think only amateurs have access to the freq. and radio then your not
living in the real world.  before you pass blame I suggest you do your
full investigation first. I hope this was a report by the press assumming
amature radio operator was at fault.. just a word of advise...amateurs
will not put up with jamming nor unfounded slander.... by the way in case
you have not heard ...to spell assume is to make am Ass out of U & ME.

Actully it's probably a stolen police radio.

Huh? Ok, you are in Canada, (where the bastard is) and frequencies might be different up there for the police, but down here in the US, commercial frequencies are closer to the cop frequencies than the ham frequencies are.

2 meters	147.99	ham
	155.19	cop
	155.04	cop
	154.60	not just commercial, but dime a dozen commercial.
UHF	449.00	ham
	458.00	commercial
	460.15	cop

You know, I don't think I'd use your guess, or the other one. I'd guess that some punk stole a cop radio, and being the stupid punk he is, thinking how funny it would be to show his disregard for the law by disrupting their communications.

Once again, I don't know about Canada, but around here some cops keep hand held two ways in their personal cars. There is nothing different between a cop's personal car and an ordinary citizen's car. They both get broken into. Down here in Contra Costa County, about 6 years ago, the Sherrif had his unmarked car broken into. [Point to the stupidity of the crook: It was at the Sheriff's Annual Golf Tourn with many many cops in presence. Point to the skill of the crook: He didn't get caught.]

There aren't many readily-available products that will broadcast on
police frequencies other than high-end "ham" radios (the cheaper ones
won't broadcast on emergency bands unless they've been modified). So
it's a safe bet that it IS an "amateur radio" set being used.

While it's not likely that the person doing this is a licensed operator,
that does not rule out that possibility. The ham test does not include
a "personality" section to weed out the assholes.

Matt, anyone with a bit of electronics savy can modify a rig to use other
frequencies -
and surplus gear is easily converted. Or snag an ARRL handbook and build one...

As to hams being upset, YOU may read it as "A" ham operator, but the majority of
the
public does not. And if the paper did not intend to sensationalize, then why
didn't
they use something like "A prankster is interfering..."? The story is
irresponsible as it
reports unverified data and allegations as facts. THAT is extremely sloppy
journalism
-- and is inexcusable.

Huh?

What if he's using a stolen cop radio? Should the paper have called
him a cop?

Up here the various police depts use various frequencies. Our locals use
865MHz, the RCMP typically use the 442 / 137 pairs. The Vancouver police use
the 143 / 148 pairs.
(Repeater inputs between 148 and 149, with the outputs between 143 and 144)
Right along side of the 2M amateur band. Anyone that owns non radio shack
radios knows dam well that right out of the box the will transmit and receive
right from 140 to 150 MHz. So ANY stolen radio could be the offending
radio. I said it on TV when interviewed, and will say it again here.
it is unlikely it was a ham, as hams know the chances of getting caught are
quite high, and the penalities are even higher. We know about transmitter
fingerprinting. (The transmitter key up characteristics are logged, so if someone
was
stupid enough to do it, and then use the same radio for rag chewing on,
```

it would be fairly easy to match the signal, some of the amateir repeaters
have this capability, where they can lock out partictular signals from keying
up the transmitter.)

You know, this thread reminded me of something funny that happened to me a few
years ago.
I hung a dipole, and had to wait a few days to get some coax to run to it. The
wire was hung in
the air & not connected to a rig at all.
Well guess what? Somebody came over and accused me of causing interference!

Everybody is not on the radio. There're on the Internet!

I sign on to the net daily now. At 14.4K compress.

While on Ax.25 it's only running at 1200 baud when no one else is on.
Other the effective baud is only 300 or 100 on VE7LAN.

I am new to the internet as well.  This is my first look at this newsgroup.
Perhaps we can get this going or else find more activity.  Any suggestions???  My
call is N5BKV

It happens all the time.

That's how you test your out neighbour to see if they are Ham friendly.

Yes I thnk so. Look for A Mac-info mirror, and search for RadFax 0.9
If you can't find it please contact me again, since I have to dig for
the URL.
As the version number is very low you can conclude it is not as mature
as you wish.

Furthermore I am also very busy in the search for such a program.

Frans Pinkse. PA2FAP

My employer, and I'm sure others, make detector diodes intended for use at zero bias. There is a pretty good article about them in the December, 1995, "Hewlett Packard Journal." If you would be happy with an SOT-23 package, the HSMS-2850 might be worth looking at. At low power levels, the output into the proper load is nearly linear in voltage versus input power; that diode has about 100mV/uW sensitivity in the frequency range you are interested in. You should be able to measure down to nanowatt levels with homebrew stuff; that's a fraction of a millivolt of RF.

> Is there a PD package available to decode WEFAX (or other) on a Mac?

Yes. I have tested RADFAX that can be ftp:d from funet (Finnish university network). Use Anarchie to get the full ftp address. Radfax uses the Mac:s internal (or external) microphone input to decode the wefax signal directly. No add-ons is needed but to get a crisp image I recommend some Audio filtering.

Subject: HOW do I Build THIS INCREDIBLE AM BOOSTER DEVICE ?
Date: 1996/03/15
Message-ID: <4ick5n$4gn@dialin01.teaminfinity.com>#1/1
X-Deja-AN: 142862680
organization: TEAM INFINITY P.O. BOX 952 Greenbelt, MD 20770 USA
newsgroups: rec.ham-radio,rec.ham-radio.swap,rec.ham-radio.packet,rec.radio.scanner,rec.radio.shortwave

HOW DO I make this INCREDIBLE AM RADIO BOOSTER, for AM DXing ?

```
           -----------
          /        \
         /          \
         |          |
         |          |       Simple Sketch
         |          |
         |          |
         \      _      /
          \    { }    /
           -----------
```

I am looking for actual plans to build the above AM Antenna Booster device. It is a REMARKABLE device in that it takes no power or batteries, does not actually attach to your AM radio in any way, just needs to be near it, and IT BOOSTS FARAWAY AM RADIO signals like you would not believe ! It also appears to be incredibly simple to build, if only I knew how.

This device, which I have seen once is made of wood, the large cirlce is a hoop of (perfectly circluar unlike the drawing) and about 18 inches in diameter, and the hoop width is about 3 inches, there is a band covered with cork in the middle of this hoop I presume covering copper windings.

The small circle in the bottom of the larger hoop is a small cylindrical device of unknown composition. The axis of the hoop and the small cylinder are parallel. The small cylinder in tangent to the hoop's inside.

There is also a dial that I assume tunes the device.

I hear that it is an inductively coupled LC resonator (equivalent to a small loop) which should be regarded as the primary of a tuned RF transformer, the secondary for which is the ferrite-cored loop within your ordinary AM radio.

They further went on to say that as such one needs to couple them (your AM radio and this device) in the appropriate manner, depending on the orientation of the ferrite in the AM radio (they find its not necessary to put the secondary (your AM radio) into the loop).

Any help and actual plans would be GREATLY APPRECIATED:

The sketch looks just like the "Scantenna" a commercial product that
does work wonderfully. They advertise in PopComm every month. The unit
is housed in a plastic case. It would probably cost you nearly as much
to build one considering the complexity of the gearing for the tuning

device. I've had mine for many years and am using it currenty with a GE Superradio III. Probably the most inexpensive combo around for AM DXing. The SRIII is going for around $40 in the Baltimore area and the Scantenna around $30 (Mail order only)

By the way if you live in the Baltimore area listen to High tech talk on WCBM 680 on Saturday afternoons starting at 2 pm, theres a store near BWI that advertises on the show that has a similar antenna to the Scantenna available at their store that has a no questions asked moneyback guarantee

Charlie

Hi,

does anybody have a list of 2m/70cm repeaters (frequencies and locations)
in Australia and in particular in TASMANIA? ... or a pointer to a source?

Please reply via email (berndm@cs.monash.edu.au), as I am normally not
reading this list.

Thanks a lot!

73,

Bernd

As seen in Feb. 96', NUTS n' VOLTS, page 52.
1-800-783-4624 Subscriptions and back issues.

Bring those dead Ni-Cad's back to life with the "Nickle-Cadmium Battery Zapper Kit".

Works with 1.5, 2.4, 3.6, 6, 9, 12 and 24 Volt batteries.

The article describes Ni-Cad 'memory', brief chemistry text, deep discharging, overcharging and 'whiskers' (dendrites) that cause the cell(s) to short and refuse charge.

I will caution you that the writer recommends that you 'zap' each cell within a multi-cell battery. This may require some battery case disassembly.

The kit appears to be very easy to assemble, even for a novice. All parts and PC Board, $18.95 plus $4.25 shipping. #C6278.

PARDON MY INTRUSION, BUT::
The Law Enforcement Torch Run has an IMPORTANT MESSAGE for All Good People

HELP! HELP!

We are Police Officers in Your Community, and we want to help mentally challenged athletes through SPECIAL OLYMPICS. The TORCH RUN is a major fund-raising arm of SPECIAL OLYMPICS. We raise money by conducting special events, fund-raisers, soliciting busineses and citizens, and selling T-Shirts.

SPECIAL OLYMPICS provides athletes training, uniforms, transportation, and the opportunities to compete in local, regional, national,& international Olympic -style events. IF YOU CAN HELP...Please contact your local police department or mail your cheque/money order to:

Law Enforcement Torch Run
c/o Ridge-Meadows Detachment
Royal Canadian Mounted Police
11990 Haney Place,
Maple Ridge, BC, V2X 9B8

Tax Receipts will be mailed for amounts of $20.00 or more (or on request)

For more info please send e-mail

THANKS FOR YOUR TIME   Keith Wilson

A beta version of RafCad-Lite is now available for free
downloading from:

http://www.ozemail.com.au/~sjandrew/

RadCad-Lite is an RF and Electronics CAD package with a difference. Full details may be obtain from the above web site.

In addition to RadCad-Lite, the above web site contains many interesting and useful links to manufacturers WWW and FTP sites as well as Amateur Radio WWW and FTP sites.

Why not drop in and take a look.

Boy, this really has a lot to do with ham radio, doesn't it?
Just another example of the greedy in hot pursuit of the
greenback without actually spending money for advertising..
I see this is also copied to alt.current-events.russia. Lots
of potential there -- get your kiosk on the Internet, hi...

Isn't it funny how by you spamming back you get your site spammed all
around.  When will you self appointed internet police learn to ignore the
post, and mail the postmaster.

SOLAR TERRESTRIAL DISPATCH

PROUDLY ANNOUNCES THE RELEASE OF

```
 ------------------------
|  S K Y C O M   P R O  |--
|------------------------|  |
|      Version  2.0      |  |
|________________________|  |
  |________________________|
```

Adding New Dimensions to Radio Propagation

NEW low PRICES: $70.00 to $125.00 USD (see below)!

SKYCOM PRO is one of the most powerful High Frequency (HF) radio propagation packages available. Here are some of the powerful new features:

*** COMPREHENSIVE RAY-TRACING NOW INCLUDES EFFECTS OF THE EARTH'S MAGNETIC FIELD AND COLLISIONS!

This is a major step forward for radio enthusiasts!

*** RAY TRACE ORDINARY AND/OR EXTRAORDINARY RAYS!

Observe how signals split into the ordinary and extraordinary components and how they each travel independent paths through the ionosphere.

*** SOPHISTICATED TWO OR *THREE* DIMENSIONAL RAY-TRACING OF RADIO SIGNALS THROUGH THE IONOSPHERE!

SKYCOM PRO Version 2.0 now has the ability to trace signals through the ionosphere in THREE DIMENSIONS using a powerful rotatable three-dimensional grid.

*** TRACE RAYS THROUGH TILTED REGIONS OF THE IONOSPHERE!

When signals pass through regions where the ionosphere is tilted, they are refracted away from the expected great-circle paths (often very substantially). Tilts can also result in chordal-hop propagation where signals may travel great distances within the ionosphere without experiencing great attenuation. SKYCOM PRO will accurately trace signals (ordinary and extraordinary components) through tilted regions of the ionosphere, precisely showing you how far signals are deviated and where they hit the ground.

*** ACCURATE COMPUTATION OF ATTENUATING IONOSPHERIC DEVIATIVE AND NON-DEVIATIVE ABSORPTION.

*** COMPUTATION OF RADIO SIGNAL FIELD STRENGTHS.

The new ray-tracing features of SKYCOM PRO now include the direct computation of radio signal field strengths (as opposed to signal "qualities") in units of dB above 1 microvolt (dBu or dB above 1 uV).

*** CONSTRUCT BROADCAST COVERAGE MAPS USING RESULTS OF THE NEW COMPREHENSIVE RAY-TRACING FUNCTIONS.

SKYCOM PRO comes equipped with an all-new utility to read the comprehensive ray-tracing results and produce fully-contoured maps of the following important quantities:

- Signal Strength (dBu).
- Ray elevation angles at the ground.
- Propagation delays (milliseconds)
- Locations where rays (ordinary or extraordinary) reach the ground.

*** TRACINGS NOW INCLUDE THE DIFFERING ABSORBING EFFECTS OF RAYS WHICH ARE REFLECTED FROM THE GROUND (DRY EARTH), THE OCEANS, AND ICE CAPS.

Signals which are reflected by the ground are attenuated to an extent that is dependent on the characteristics of the ground. For example, signals are reflected with relative ease from the oceans but are attenuated more extensively if reflected from dry ground. SKYCOM PRO attempts to handle these different reflection conditions by referencing an earth/ocean/ice geographical database.

*** PRODUCE 24-HOURLY GRAPHS OF MAXIMUM USABLE FREQUENCIES ALONG ANY PATH.

Users can now more easily determine what times of the day may support higher frequency radio propagation. It is based on ray-tracing results and is therefore slower but more accurate than the empirical methods employed by other propagation software.

*** DEFINE THE TRANSMITTER ANTENNA RADIATION PATTERN.

SKYCOM PRO will examine antenna radiation patterns when comprehensively tracing rays through the ionosphere. Resulting signal strength values therefore include effects of antenna gain at defined radiation azimuths and angles of elevation.

*** SKYCOM PRO INCLUDES APPROPRIATE DATA FOR MANY DIFFERENT TYPES OF ANTENNAS.

SKYCOM PRO includes the following built-in antennas:

- Simple long-wire
- Sloping V
- Inverted L
- Omni-directional
- Multi-band Tropical Arrays
- Multi-band Aperiodic Reflector Arrays
- Yagis
- Quadrants
- Dipole Arrays
- Log-Periodic Arrays
- Rhombics
- Monopoles
- Curtain Array

And of course, you can create your own antenna radiation patterns.

*** COMPREHENSIVELY RAY-TRACE SIGNALS THROUGH THE IONOSPHERE USING A VARIETY OF SELECTABLE STANDARD MODELS.

SKYCOM PRO comes equipped with FIVE available standard ray-tracing models, THREE standard models of the Earth's magnetic field, THREE standard electron collision frequency models, FOUR standard models of electron density, and TWO ray-tracing integration techniques.

*** SKYCOM PRO REMAINS VERY EASY TO USE AND UNDERSTAND.
Our Users Manual has been substantially enlarged to explain in detail how to use the new features of SKYCOM PRO.

*** SKYCOM PRO CONTAINS AN EXTENSIVE CONTEXT-SENSITIVE HELP SYSTEM
Press F1 for help at any of the prompts.

*** DETAILED NUMERICAL RESULTS OF COMPRENSIVE RAY-TRACINGS CAN BE PRODUCED.

- Ground Range of the Ray.
- Lateral Deviation of the Ray measured as the change in bearing from the transmitter.
- Lateral Deviation of the Ray measured as the change of bearing at the Ray location itself.
- Elevation angle of the Ray measured from the transmitter.
- Elevation angle (or inclination) of the Ray itself measured from the horizontal.
- The polarization of the ray (including both the real and imaginary parts of the polarization).
- The Group Path.
- The Phase Path.
- Ionospheric Absorption (deviative and non-deviative).
- Change of frequency (or Doppler shift) if encountered.
- Total traversed geometrical Path Length.

*** DEFINE THE ALTITUDE OF THE TRANSMITTER ABOVE THE SURFACE OF THE EARTH FOR THREE-DIMENSIONAL RAY-TRACING.

SKYCOM PRO includes all of the other features which complemented previous versions of SKYCOM. Unless otherwise stated, most of the features listed below do not yet make use of the new comprehensive ray-tracing features, but use the simpler and faster ray-tracing methods previously employed to derive their results. A few of the more significant features include:

* PERFORM FULL HF OR VHF SPECTRUM ANALYSIS
* Study the effects of Sporadic-E on radio signals.
* Generate Oblique Ionograms between any two locations.
* Simultaneously observe changes in the electron density as the signals are traced and refracted from one point to another.
* Examine the effects of signal convergence and divergence caused by ionospheric refraction.
* Directly print-out any of the many available graphic screens produced by SKYCOM on your printer. This feature is supported in all of the new comprehensive ray-tracing functions and features of SKYCOM PRO.
* Estimate effects of solar flares (minor or major) on the ionosphere and signals traversing the daylit sides of the influenced ionosphere.
* Determine the total distance traversed inside or outside the ionosphere.
* Examine the effects on transpolar or transauroral circuits (that is,

those signal paths that cross into or through the auroral zones or polar regions where significant signal degradation can occur).

- Determine the total distance traversed by signals inside the influential auroral zones. A dynamic model of the auroral zones is employed.
- Determine optimum azimuths and elevation angles for transmitting or receiving to/from any area of the world.
- Determine ray-traced Maximum Usable Frequencies for practically any path.
- Change the colors used by SKYCOM's menu and text to anything you desire.
- PRODUCE IN-DEPTH COMPLEX GLOBAL MAPS OF IONOSPHERIC CHARACTERISTICS
  The range of constructable maps include:
  - Maximum Usable Frequencies for any time of day.
  - M-factors for 3000 km distances.
  - Critical E or F2 layer frequencies.
  - Solar zenith angles (elevation of the Sun).
  - Maximum height of the F2 layer.
  - Transverse CROSS-SECTIONS of the ionosphere for any path.
  - geomagnetic DIP or inclination angles throughout the world.
  - Total Field Intensity of the geomagnetic field.
  - Magnetic Latitude or Modified DIP angles.
- SELECT TRANSMITTER & RECEIVER LOCATIONS FROM OUR GEOGRAPHICAL DATABASE OR ADD YOUR OWN LOCATIONS TO THE DATABASE.
- YOU CAN EVEN SELECT GEOGRAPHICAL LOCATIONS BY TYPING IN GRID-SQUARE DESIGNATIONS. FOR EXAMPLE, "DO19", OR "QF10", OR EVEN THE MORE ACCURATE EXTENDED DESIGNATIONS "DN34UH" ARE SUCCESSFULLY TRANSLATED.
- Rigorously compute the FOT, or Frequency of Optimum Transmission, ensuring at least 85% of the transmitted power is reflected by the ionosphere.
- COMBINE MAPS OF DIFFERING TYPES

SKYCOM PRO Version 2.0 is a user-friendly, sophisticated and extraordinarily powerful software package. If you have any questions, or require additional specific information, contact Cary Oler: Oler@Solar.Uleth.CA, or Oler@Uleth.CA, or COler@Solar.Stanford.Edu. Alternatively, write to us at our address below, FAX us at: 403-756-3008, or leave us a message at: 403-756-2386.

Contact Oler@Solar.Uleth.CA or COler@Solar.Stanford.Edu for a comparative analysis of features between SKYCOM PRO and five popular HF propagation programs.

REQUIRED SKYCOM PRO INPUTS:

- Date and time.
- Geographical location(s) (latitude and longitude values).
- Sunspot number or 10.7 cm solar radio flux value (available from WWV or WWVH noted below). Or, values can be derived through our BCAST software (below).

OPTIONAL SKYCOM INPUTS:

- Geomagnetic A-Index (available from radio stations WWV or WWVH at 2.5, 5, 10, 15, or 20 MHz at 18 minutes past each hour).
- Location and magnitude of sporadic-E activity (available from our daily ionospheric summaries on the Internet or on computer BBS).
- Magnitude of solar flare activity for SWF analysis (again, available through our daily solar summaries on the Internet or on our computer BBS).
- Transmitter power (in Watts).
- Transmitting Antenna Radiation Pattern.
- Magnitude of polar cap absorption (if present, can be determined from our daily solar summaries on the Internet or on our computer BBS).

SKYCOM SYSTEM REQUIREMENTS:

- IBM or compatible computer system. Systems with 386 or better processors are highly recommended, but not required. Will operate fine on older computers, but more slowly.
- Math Coprocessor strongly recommended, but not mandatory. 486 or better microprocessors have built-in math coprocessors.
- MSDOS 3.3 or higher. Under the configurations we have tested, SKYCOM appears to work under the DOS mode of Windows 95. However, it has not yet been extensively tested under that new system.
- VGA graphics capabilities required. All graphics are VGA quality.
- At least 540 K of available free memory.

SKYCOM SOFTWARE PRICING INFORMATION:

Appropriate order forms have been appended below. Consult the order forms for specific pricing information.

SPECIAL BULK-PURCHASE DISCOUNT

Bulk purchases of SKYCOM PRO at discounted rates can be requested provided at least three SKYCOM PRO packages are requested per bulk order. The regular rate of $110.00 USD applies for less than three orders. For three or more orders, SKYCOM PRO is priced at $80.00 USD each. A special order form for Bulk Orders is included below. Print it out, fill it out, include the appropriate payment, and mail it to us. We will then return the requested number of SKYCOM software packages to the indicated shipping address.

SKYCOM PRO Version 2.0 ORDER FORM

Solar Terrestrial Dispatch

P.O. Box 357
Stirling, Alberta
T0K 2E0
Canada

I am interested in purchasing the SKYCOM PRO High Frequency Ionospheric Analyst Software. I have remitted a check or money order made payable to the "Solar Terrestrial Dispatch" in United States dollars (personal checks in U.S. currency are accepted) for the amount(s) listed below.

SKYCOM PRO is ONLY shipped on 3.5" high-density (1.44 MB) disks.

Please ship the software via Air-Mail to the following address:

Address: ____

____

____

____

E-Mail: ____

Phone: ____________________________ FAX: _______________________

Please Check the appropriate box below (prices include S/H):
[__] - SKYCOM only, without a printed manual ($ 110.00 USD).
[__] - SKYCOM with a printed manual ($ 125.00 USD).

If you have previously purchased SKYCOM from us:
[__] - UPGRADING to SKYCOM PRO without a printed manual ($70.00 USD).
[__] - UPGRADING to SKYCOM PRO with a printed manual ($85.00 USD).

Check the following if applicable:

[__] - Please ship ____ Extra Printed MANUALs to me. I have included the required funds ($15.00 each) for printing, shipping, and handling.

I have also enclosed the appropriate funds for the following products:

[__] - BCAST Version 1.03 (Solar & Geophysical Database Management / Analyst Software + Limited Database. $45.00)

[__] - Extended Database for BCAST Version 1.03. ($ 45.00 if registered, otherwise $50.00 if not)

*** CANADIAN RESIDENTS -- NO G.S.T. REQUIRED! ***

I understand that shipment may require between 4 and 6 weeks, depending on the delivery point and the postal service. However, please RUSH my order and ship via AIR MAIL as soon as possible. Thank you.

Date: __________________________ Signed: _________________________________

SKYCOM Version 2.0 BULK ORDER FORM

Solar Terrestrial Dispatch
P.O. Box 357
Stirling, Alberta
T0K 2E0
Canada

We are interested in purchasing at least 3 copies of the SKYCOM PRO High Frequency Ionospheric Signal Analyst software at the discounted rate of $80.00 USD each. We have remitted a check or money order made payable to the "Solar Terrestrial Dispatch" in United States currency for the amount listed below: (All prices include Shipping and Handling)

Please Ship: [_____] copies at $80.00 each on 3.5" HD disks.
(Does not include printed manuals - see below.)

Please specify the shipping address below:

SHIPPING: ____
ADDRESS

____

____

____

Contact Person: ____

Contact E-Mail: (IF AVAILABLE)____

Contact Phone: (MUST INCLUDE)____

Contact FAX: (IF AVAILABLE)____

Check the following if applicable:

[__] - Please ship ______ Printed MANUALs to the Shipping Address above.
($15.00 USD each).

We have also enclosed the appropriate funds for the following products:
Specify how many of each in the box provided.

[____] - BCAST Version 1.03 (Solar & Geophysical Database Management / Analyst Software + Limited Database. $45.00)

[____] - Extended Database for BCAST Version 1.03.
($50.00 USD)

TOTAL AMOUNT ENCLOSED: $USD____________

*** CANADIAN RESIDENTS -- NO G.S.T. REQUIRED! ***

We understand that shipment may require between 4 and 6 weeks, depending on the delivery point and the postal service. However, please RUSH our order and ship via AIR MAIL as soon as possible. Thanks.

Hallo allemaal,

Graag wil ik de scannerluisteraars onder jullie wijzen op mijn homepage: de Scanner Homepage Nederland. De bedoeling van deze pagina's is het verzamelen en publiceren van actuele en gecontroleerde frequenties. Neem eens een kijkje op:

http://www.pi.net/~jvduin/home.html

Help mij door goede (door jezelf gevonden) frequenties, of andere interessante informatie te sturen naar:

jvduin@pi.net.

Hi,

I am writing from Hong Kong. I own a SONY 2010, and wish to buy a new SONY set.
Could anyone kindly let me know their experience with the SONY W-77 and its performance over the SW-55? Which one should I buy??

I would appreciate you E-mail your comments and suggestions to:

alepara@hk.super.net

Thank you very much in advance,

I own a Sony SW-77 and have been very happy with it's performance. I live
in eastern Kansas USA which is one of the most difficult reception areas
in the world. I think that here the Sync. operation of the SW-77 is a
great help in usable reception. Also the 77 has a Different IF frequency
for each reception band to maximise reception.

Hello to all who read this message.

I am letting you all know that the Burnaby Radio communications WWW page is now running stable, you should be able to check it out at any time.

Some of you had problems before accessing our WWW page, but that problem should be over now. We have changed servers so our WWW Page should work all the time now.

The page is at "http://www.burnabyradio.com/ham/brc.html"

We are: Burnaby Radio Communications Ltd.
4257 E. Hastings Street
Burnaby, B.C. Canada
V5C 2J5
Phone: (604)298-5444
Fax: (604)298-5455
BBS: (604)298-3283

WWW: http://www.burnabyradio.com/ham/brc.html

Please visit us!!!

And please fill out our form, and you will receive our latest price list.

Thanks.

Have you ever bought anything from Oklahoma Comm Center (1-800-765-HAMS)??

I'm looking at buying a radio mail order from them. They are $30 cheaper than most other stores with free shipping and I'm not sure of thier reliability.

e-mail to gregkopp@en.com or n8jms@cars.org

They are WAY up on the north side of OKC (maybe even Edmond) and I'm way down
on the south side. But I've bought several things from them, no problem.
They have a small display area, but are basically geared to mail order.
They've been in business for a few years now. They try to stay competitive
even when Hams want the wholesale price. I've seen em sell a radio for
five bucks over wholesale. I guess there's money in volume...

I've dealt with OCC on 3 occaisions, beginning about Sept. 1994.  I have no
complaints with them.  I can't speak about return policies or anything, since
I've had no need to return, but I'd encourage you to buy from there.

73, Jerry

I LIVE in OKC, and I buy from them regularly. For the most part
they're nice guys, and they seem to work hard to take care of their
customers. I've made the same discovery, i.e., they're cheaper than
most of the other mail order places. Give them a try, I don't think
you'll be disappointed. Tell them KC5KBC/John gave them a thumb's up!

Add me to the list of satisfied customers - I called to order a used radio last tuesday, and it was in my hands on Friday (in Denver). The shipment included MORE accessories than they originally claimed, they didn't charge for shipment, everything was in excellent shape and well packaged. Definately pleased at this end.

Hi Greg,

I live a few miles from Oklahoma Comm Center and drop by often for a chat with Mike and Tony. They are the two guys you will most often deal with when calling on the phone. They are both knowledgeable active hams and are glad to share their experiences to help you pick out the rig that is right for you. I have never seen a better price on equipment or support for the buyer. I will admit that they are more geared for mail order than counter sales and if you walk into the showroom, you might wait awhile before they get around to helping you. If you are looking for reassurance, you have it. They are on the up and up and serious about selling you ham gear now and in the future.

P.S. - If you talk to Mike, tell him Glenn said he is a bottomfeeder. If you talk to Tony, have him pass the message to mike. o<:-)%

This all the more reason, if the VPD are listening, to get a voice-encryption system with error correction installed. it's harder to jam police computers and going digital for voice communications can punch through interference. unfortunately the bead counters think that it's cheaper to catch the nuisance.

Non-copyrighted story.

By-line: AURAL SEX TUNED IN

By: Roberta Staley, Staff Reporter

A ham radio operator is endangering lives by jamming police radio channels with recordings of a couple having sex.

"It's extremely dangerous," Vancouver police Insp. Al Forbes said last night.

"It not only puts the people we're trying to protect in jeopardy by jamming the channel, it also puts our own members at risk," Forbes said.

The pornographic sounds and two blasts of country music were first heard Thursday night about midnight. The second incident happened several times last night starting about 7 p.m., said Forbes.

"I think it's a video and they're playing the sound-track over the channel."

Police switch the channel off and begin communicating on another one. The cheeky radio operator also switches over, jamming the new channel.

"They obviously know all the frequencies," Forbes said.

In emergencies, police can be heard over the interference, although it remains distracting, he added.

The inspector said it's unlikely the radio pervert will be caught.

End of story.

I would think the person doing this is NOT a licensed ham radio
operator. Either way, they don't know, so calling them a ham operator
is really poor reporting and probably hurts the publics perception of
amateur radio. The VPD should go to the same system that CLEU is
using.

Any bets it's a CB type? Maybe a class action suit for defaming the good name of
ham operators would get the papers' attention.... ;-)

Given that scanners are dirt cheap -- and that there are several publications
which list
the radio frequencies in use in BC, and who uses them -- it is simple to locate
the police
channels. Didn't the VPD learn anything after that unfortunate raid several years
ago?

Has anyone there thought to contact the Department of Communications and do a
little

triangulation work? The transmissions, from the sounds of it (sorry about the
pun....),
are long enough to get some rough data....

Just how do these people know it is a ham doing these things anyway.
Are we the only people that have access to radio equipment?

and why would it be so difficult to hunt down such a persistent little
pest?  I would bet a modest amount that the local area hams would love the
opportunity to restore their good name in the media, by nabbing the
son-of-a-gun themselves!

I would say that reproducing the story in its entirety, without being in the context of what is legally defined as "fair use", is a violation of copyright law. I doubt the Province publishes its "journalistic" slop free of copyright. What would prevent anyone from reproducing the entire contents of the paper for profit (besides an unexpected upward shift in the IQ level of its readership)?

So couples having sex are "pornographers"? Only the Province would let that one go. Either it's the sounds of a couple having sex (not pornographic) or it's a porn film soundtrack. As for the country music, now THAT'S disgusting!

Assuming that the article is quoted correctly, the first conclusion should be that a police/government person is responsible for the broadcast since it is on police/government bands not ham bands. After that it would be any ones guess. A person who has participated in ham or CB operation would be a good guess but only a guess. If ham is defined as an "amateur radio operator" then technically the perpetrator can't really be a ham so much as a "pirate" station since a ham by definition doesn't broadcast any thing but distress signals outside of ham bands.

Unfortunately hams are not the only groups that suffers from this form of slander. Any group which participates in activities of which the editors do not approve or understand is subject to association with the nefarious activities of individuals. If any thing good can come from this, the next time you read an article associating evil doing with some group see if you can find the "other viewpoint" that you are now experiencing before you let the media lead you to a false conclusions.

Of course it would be great to get the paper to explain it's position or requesting a retraction would be good. Assisting in the apprehension would be even better since that would get good coverage.

I'll be glad to contribute to a fund if any body in the area needs help getting equipment to do so.

Ed

I think this situation warrants serious attention by the ham community. The newspaper has made a claim in print that a ham radio operator was responsible for the illegal activity, and apparently has done so without a shred of evidence supporting the claim. The amateur radio community is very sensitive about its public image, given the predisposition of the public to blame us for tvi/rfi problems, and for "unsightly" antennas. This type of news story, which suggests that hams are sabotaging essential government services, can do untold harm to our reputation. (I just hope the guilty culprit doesn't turn out to be one of the dingbats that appear nightly on 75m -- but that's another thread....)

It's another prime example of media bullshit.  Take note folks, this is NOT
the only story the media 'reports' and distorts, full of half-truths and
lies.  This same kind of twisted 'reasoning' is the reason the media equates
hunters with poachers, gun owners with crime, etc.

I would like to know on what authority the journalist draws the conclusion that the offender is a ham. Did he broadcast his call sign? I doubt it, otherwise he would be easy to catch. The hams I know have spent a lot of time and money getting their licenses and equipment. Far too much to waste it on malicious interference. To try and pin the blame on the ham community without sufficient proof verges on slander. I should hope the The Province Newspaper's editorial department will receive rebuttals from their local ham community. If my local paper published such baseless acusations I would certainly not let it go unchallenged.

I think the use of the term "ham radio operator" and the statement at the end of the item stating that the police do not expect to catch the culprit are a ruse designed to give the bozo a false sense of security and encourage him to more or longer transmissions. In other words, the story is in my view a police plant to flush out the idiot.

I cannot imagine that the Vancouver Police dept with all the radio techs they have would not know how easy it is to triangulate the source of the transmission. I also can't believe that they would not have contacted DOC yet about it to locate the transmitter. They know the frequencies the guy is blasting, so all they have to do is just sit and wait for him to get on the air.

Actually, I'm quite sure that some of the local radio clubs would have a very good time organizing a fox hunt to locate the guy, just to clear the name of their hobby.

This sounds to me like a prank EE students might want to pull off. I doubt that a ham would be stupid enough to think he would not be caught and want to jeopardize his licence and equipment over something like this.

So? I know of no law (in the US) which prevents stores like Radio Shack from selling a ham transciever to a CB'er or even an unlicensed geek. I know of no law, preventing Walnut Creek CDROM from selling the QRZ diskette (which included radio mods) to an unlicensed person.

Also, I know of a lot of Hams, who use commercial equipment to get on the air WITHIN the Ham bands OPERATING WITHIN THE CONFINES of the license. We don't call them "commercial radio operators" though, so why should we call someone using what MIGHT be Amateur Radio Equipment, operating outside of the Amateur bands, and not operating under any known license at all, a ham?

Now you might ask, "But why would someone go out and pay all that money just to buy ham gear to distrupt police communications?"

What money? I bought a 2 meter, 50 watt Motorola trunk unit for

$15. I also bought a UHF trunk unit for $25. Of course, you have to recrystal them... provided you didn't purchase them from the PD scrap pile. Then there is the programable HT's. With a computer, a cable, and some copied software, you could reprogram an existing, found or stolen HT for the police frequencies... provided you didn't steal it from the cops to begin with.

And then, there are all those CB types which I hear jamming on ham repeaters, never giving callsigns, and eventually getting busted for unlicensed operation. Those guys were not Hams, Matt, just like a security guard who carries a cop gun and a cop club, and a cop attitude isn't a cop.

I don't recall seeing any mention in that article of the entire "ham community" being under suspicion, only one specific ham operator.

>should hope the The Province Newspaper's editorial department will
>receive rebuttals from their local ham community. If my local paper
>published such baseless acusations I would certainly not let it go

Oh please. Read the FIRST PARAGRAPH of the article again. *A* ham radio operator.

>:   A ham radio operator is endangering lives by jamming police
>: radio channels with recordings of a couple having sex.

No mention anywhere of more than one person being responsible, let alone an entire "community". If he's using a ham radio (likely, since as I said before, there isn't much else readily available that will broadcast on those frequencies), he's a ham radio operator. Simple logic, no?

Your friend and mine,
Matt

I sorry too hear the story about the police radio jamming.. I am alos a police officer in the U.S. but I did not see where the article cleared showed a amateur radio operatorwas the person doing the jamming. If you think only amateurs have access to the freq. and radio then your not living in the real world. before you pass blame I suggest you do your full investigation first. I hope this was a report by the press assumming amature radio operator was at fault.. just a word of advise...amateurs will not put up with jamming nor unfounded slander.... by the way in case you have not heard ...to spell assume is to make am Ass out of U & ME.
ASS U ME

>It transmits and Receives on 163.5375 MHz. It has a 15 Volt NiCad. It is
> xmit: 18170.8

The transmitter in these uses freq. triplers to get up from the xtal freq. to TX freq. 18170.8 x 3 x 3 = 163537.2. Mine is a 462 MHz unit that has one more tripler to get up there.

>   rcv: 48912.50

Let's see... receive xtal = (Tx freq - IF freq) / n; where n = 3,9,27 etc. Using n=3 we get an IF of 16.8 MHz, which sounds reasonable. International Crystal Mfg. has crystals for these radios - call them at 405 236 3741 and tell them what you have. You may need model number and "chassis number" which is a number like NUE6001BA that you can find inside the battery compartment. The xtals are a bit pricey - $15 to $25 each, but what the heck, I only paid $10 for the radio at a flea. You will need to re-tune the tuned circuits in the radio, and for this you will need the Motorola manual... try Motorola or a local service shop for that. I copied the 450-488 MHz radio manual that another ham here had around. Make sure whoever knows you are re-tuning to a ham band, or else they'll want to know your commercial license #!

By the way, I have a line on cheaper crystals from a different source, still waiting for someone to get back to me on that.

>There is also a "PL Reed" that I will probably need.

This is pre-microprocessor coded squelch technology. A tiny mechanical reed functions similar to a quartz crystal, except at audio freqs. If you're going to use the HT to get into a repeater with PL tone access you need it, otherwise you don't, like for simplex. Mine came with one, but you could always add one of those tiny PL decode/encode boards from the back of QST.

>   Last (and least?) I need a charger for the Ni-CAD.

Yah, these radios typically are placed in a "drop-in charger" which does the job. I'm not sure how I'm going to handle this myself... The battery that came in mine was good, though, and charged up to 15V no problem. Pick up a spare at a flea, as Moto wants something like $75 for them.

>   Doug N8TUT

Good luck with the mods! I'll be doing mine as soon as I find out about those cheap xtals! Makes an interesting project...

I am a candidate for the Wisconsin legislature this fall and (as an Extra who cares about ham radio concerns) would like to prepare a sheet for my district's ham population. What I am interested in is ideas for state laws that hams would appreciate...

Ideas I have so far include:

1) Opposition to scanner/radio bans, etc.
2) Adoption of PRB-1 (with possible revisions) into statutory form (I know about federal preemption, but this would make cases easier for hams...)
3) Developing stronger partnerships between state and ARES/RACES, etc.

Any input (or money <grin>) you could provide would be appreciated!

```

-How about protection from lawsuits related to TVI, telephone interference,
and other forms of RFI caused by poorly designed consumer products and/or
Part 15 devices operating on frequencies assigned to the Amateur service?

On a VERRRRRY loosly related subject, how about eliminating the
"industrial exemption" clause in your state's engineering registration law?
These exemptions, which most if not all states have, allow unlicensed
"engineers (who may not even have any engineering education or experience)
to practice as engineers as long as they only design manufactured goods. Would
you allow an unlicensed physician, who can only kill one person at a time to
practice medicine? How abount an unlicensed automtive "engineer" who could
kill many people with a single mistake?

Thanks, and good luck!!

73,
Pete Goodmann, P.E., NI9N

One of the arguments against this suggestion is that a PE license is no guarantee that an engineer will do safe, quality engineering work and never make a mistake. All the industrial exemption does is allow a company to accept responsibility for its products in lieu of an individual employee (i.e., engineer). Therefore, the employee does not require a license and the company assumes all responsibility for ensuring that he/she is properly trained and all liability if he/she designs a poor or unsafe product which is a danger to the public welfare.

On the other hand, the private engineering practitioner must have a license because he/she is directly responsible when something goes awry. But regarding physicians, even licensed physicians sometimes make mistakes, so what does the license prove? It doesn't prove competence, it merely proves that the individual had, at the time of licensing, enough knowledge to be judged competent by a review board. But "being judged" competent isn't the same as actually "being competent."

What about the fact that, in many states, a PE license makes NO REFERENCE to the particular engineering discipline which is the licensee's field of competence? Does this mean that a PE who's area of expertise is EE can sign off on a blueprint for a bridge because he/she is a PE? If that's true, I'd rather put my trust in a company that someone waving a piece of paper.....

No flames intended here, BTW; in fact, I agree that a PE license is a good and useful thing. I fear, however, that industry and some of the professional societies have conspired to create a situation whereby "going back" to licensing all engineers will be impossible to achieve. If only one state does it, then industry will just pack up and move to a state that doesn't do it (and be welcomed with open arms!). Ergo, it would be necessary to create a national law (Ugh! Just what we need!) requiring that all engineers be licensed; otherwise, it will never happen.

The first three pargraphs above are sort of "Devil's Advocate" statements which probably only scratch the surface of arguments which would rear up in opposition to your suggestion.....

I see a couple of problems with the above.

First, consider that the state doesn't have any authority in the areas of TVI, RFI, or the design quality of consumer goods. The original poster is running for a STATE legilature. (FCC has authority for all of the above, and has claimed such will through federal preemption of same.)

The second problem I see with the statement Pete made is the assumption that these consumer goods are "poorly designed." Such goods are designed to meet specific standards put in place by FCC, et al. Part of what I use as a working description of a good design is whether the product does the required job for the cheapest manufacturing cost. From this point of view, designing in protective circuitry to eliminate interfernce from an amateur radio station as an example, isn't required, would make the product cost higher, and therefore, doesn't meet the metric I mentioned!

This isn't to say that I wouldn't like to see such protective circuitry in consumer electronics. The reality of being a designer in the consumer world is that these protections AREN'T required, and consequently aren't there. The place to go bang on is either Congress, or the FCC who DOES have the authority to mandate such design practices. You simply aren't going to see them there until it is mandatory. I guess my main points are that the original poster isn't in a place to help, and the designers aren't the ones to blame.

Lastly, part 15 devices are allowed to run on Amateur service frequencies due to FCC policy. Again, this is the place where any corrections are going to start, though I doubt such will ever occur. ARRL DID comment about possible interference when the new part 15 rules were adopted. Their comments fell on deaf ears.

Responding to the above is the REAL reason I'm posting! Pete, as soon as a PE license has RELEVANT material, i.e. tests me on items that are relevant to design field I'm in, then I'll consider going and getting a PE.   Currently, the PE is an absolutely USELESS piece of paper for me and at the same time has NO bearing on the field I'm in. If I were designing bridges or buildings this wouldn't be true, but the current test structure in CA doesn't come close to being relevant to computer design! For instance, there just isn't that much need to apply fluid flow theory to designing a new PC. I need to know about computer architecture, computer languages, functionality available in current logic families, compatibility between logic families, EMI, RFI considerations, etc. Most of the above ISN'T covered on the PE last time I looked. The fact is that they would ask me things that I forgot soon after I graduated that have no bearing on what I see as a practicing engineer in a commercial setting. Consequently, the test does NOTHING to insure that I am competant to practice in my particular specialty.

So, to answer your question...Would I want an unlicensed automotive "engineer" to design the vehicle I'm riding in... I suspect I already am ;-) So, I guess I wouldn't mind! Certainly, there have been vehicle recalls over the years due to design mistakes, but if memory serves, alot of these were due to management decisions, not engineering decisions, i.e. the design flaw was discovered, but management swept the issue under the rug. Happens all the time. How would a "licensed" engineering staff have made a difference here?

__
Steve Wilson, KA6S - PE ;-)

That's assuming that having a P.E. means you know what you are doing. Or that going to college teaches one what the real engineering world is all about. It takes more than a piece of paper to make an engineer. After all Apple wasn't founded by degreed or PE'ed folks. Neither was Microsoft...

Does the title of engineer make them one legally? I have been a Field Engineer, Systems Engineer and Proposals Engineer, but have my college background in Geology/Meteorology and no PE. (I also had a better understanding about the real world of engineering and electronics than a many of my degreed and/or PE'd counterparts.

I'd rather see more emphasis put on licensing managers. After all, the Challenger was the prime example of management saying "Ship it" when it wasn't ready you'll ever find. No matter what the engineers or PE's say, managers have a lot more say in most companies.

Yes, I know thats not ham radio. But this is:

If my antenna(s) get struck by lighning am I liable to my neighbor?
I've had this happen to me with no damage but my neighbors TV got zapped.
(I fixed it, a blown fuse). Any legal eagles have any ideas on this?

You may not know it, but they already do! The Federal government employs physicians who need not pass the licensing exam of the state they are practicing in. I haven't noticed that the veterans are dropping like flies from inadequate care, though.
Having worked as an 'unlicensed engineer' for RCA designing microwave circuits (back when they still did that!), I don't see the need for eliminating this exception. Perhaps you can cite some cases where having passed the PE exam would have saved lives and reduced damages.

Yours, in curiosity,
cantrell

There was a case in California where a ham with CAP/MARS capability on his HT called - after attempting to get help on ham band - for aid on a police frequency. His companion was badly injured due to a fall, and he was in a remote area. The ham had his radio confiscated by the police in conjunction with the FCC.   I found the idea that the ham was being punished for attempting to save a life totally uncalled for, and legislation recognizing special circumstances where a radio operator could use "unauthorized" bands without worrying about being subjected to harrasment later, would be very helpful.

In my opinion the comparison does not hold. An engineer works typically for
a company and they can interview and test the engineer before hiring them.
A physician works with individual patients. An individial patient does
rarely have the skills or the time to interview a physician wether he knows
any medicine or not.

Christian   KD6WYC

Oh BTW. If you get elected, don't worry too much about special ham issues. Just
make this place a little better for everybody living here...

Oops, please make the FCC more efficient. I don't have any gripe with whom gets a
license and who doesn't, but why does this require 8 weeks handling?

Azden PCS-6000H 2 meter mobile tranceiver w/antenna
 - 45 watts with 10W low power setting
 - 20 channel memory with scan.
 - Very easy to program.
 - Wide frequency coverage (receive 118-135.995 MHz AM aircraft
   band, 140-173 MHz FM with transmit over 140-149.995 MHz).
 - Built-in tone encoder, numeric keypad on mic
 - Mobile antenna. Base loaded with 5/8 wave stainless whip.

Both are about 4 years old and in perfect working condition. I sold
the truck they were in and don't plan to replace it.

The comparable current model is $340 from Azden + about $50 for the
antenna from a mail-order company.

Will sell both for $200, and I'll pay shipping anywhere in the U.S.

No risk purchase: charge it to your Visa, MasterCard or American
Express card. If you're not satisfied, the credit card company will
ensure that you get your money back.

Yes and no, the subject is very contriversal (sp?) as you will probably soon find out :-).

The GIANT antenna will probably indicate that your neighbor is 'running' HF. These frequencies are not suspected as widely of producing the danger from non-ionizing radiation as VHF/UHF (although if you were talking of extreme proximity, such as single feet distances, lukemia would be of some concern).

I have heard of some studies that would conflict with the above statement, their methods have been questioned.

>Is there any risk here?

If you have concerns, your neighbor should be happy to work with you. Most hams will go out-of-their-way to help.

>
>I'd appreciate e-mail, as I don't read this group regularly [See line 1
>:^)]

I understand your concern, and practice as many safety principles as possible to minimize the RF radiation into the house as possible, but at 120 feet away, the field strength should be well within safety standards set forth by ANSI.

I'm on the verge of buying my first amateur radio transceiver.
My major choices at this point (both 6-meter capable ICOMs) are:

- ICOM 736
- ICOM 729 + AEA or MFJ portable allband antenna

Prior to my purchase, I welcome comments from hams with experience
with these or other 6-meter capable tranceivers.

Thanks.

I missed the beginning of this thread so I don't know if I am thinking of the same thing. Rainbow Kits has an Amateur X-band CW transmitter that JUST HAPPENS to trip radar detectors. What would happen if this device was pointed at a speed radar device, particularly if the device was on the X-band?

I had an idea a while back that would be an active version of the CHiPs detector. The cops all have repeaters in their cars for the purpose of relaying signals from their hand-held units to base and back.

It would be easy to design a hand-held unit that would bounce signals through this equipment and measure the propagation delay. This would then tell you exacly how far away the cop car was. It is possible that since the cop's unit is FM that you could bounce a CW pulse through there with very little interference.
Anyone have any ideas on how to make this work and how not to get caught?

Wouldn't work. The propagation delay through the repeater is variable and can be relatively long. It is a common feature of 2 way repeaters to contain an analog delay line that enables the complete elimination of the squelch tail. Similarly, the delay between detection of

carrier and the keying of the transmitter is long and potentially
variable depending on a number of things such as supply voltage and
temperature.

Any particularl reason you felt the urge to post that question to
irrelevant groups such as alt.drugs?

John

In the same vein as a detector, a jammer would be even easier. Of course the
filth would immediately try to triangulate and confiscate (i.e. STEAL) said
device. You could use it in a mobile environment, jamming for short periods
and then moving to a diffent area to jam. It would cause the filth some nice
headaches, their communications being fragged at random times. Ideally one

would have many of these devices, and friends to operate them. That, or be a
tad more complex, have them activated by a signal from you. You could move
their locations every day or three.

Here's how to have a little fun, go into a radio shop and ask for a
gigahertz amplifier. It will cause a slight panic in a radio technician
who's worth his salt. Because all one would have to do is hook an
appropriate antenna, with a resonant coil tuned to the radar range

and feed it through the amplifier to create a feedback loop. Feedback loops would work havoc on all police radars.

Just imagine a very large amplifier. Heh Heh Heh.

By the way, the FCC maintains a very good team of people to track down illegal broadcasting. We were transmitting data on the VHF band and there was some Baptist preacher who was transmitting prayers to heaven on the same band. They located him very quickly. I think they use triangulation to locate the signal. I think one doing anything like this thread is talking about stands a very high chance of getting caught.

It certainly "communicates" the speed of the oncoming object, doesn't it Chucko? How's the cop going to prove that it didn't contain information that you as a duly licensed operator found to be interesting? (you sure as hell don't need to prove anything else.)

You can quote me.

Dan, I think you (and many others) are missing the point of an amateur radio operator using his license as a backup for jamming police radar. This can be construed by many (judges, FCC NAL handlers, etc) as obscuring communication, and or one-way broadcasting.

Even if you do mange to beat the system you ARE GIVING THE HOBBY A BAD NAME. The intent of amateur radio is to PROMOTE GOODWILL THROUGH COMMUNICATION. NOT jam some cop's radar so you can evade a ticket. I think a lot of you people need to brush up on your part 97.

Well then lets get cocky!!

Install these jammers with a timer to be set off all around town at
different intervals.

RESULT: HAVOC

Add some honey and Presto: the birds and the Bees and Calcium Inos

: Boys, where's your electronics knowledge? Simply interpolate the incoming
: doppler signal and fire it back at him at whatever shift you want. At
: higher power. He does it - all you need to do is sense it and react. Fast.

React at _what_frequency_?

Tell me, what's the doppler shift, in Hertz, of a 10GHz signal when returning from a target with a velocity of 100mph, directly at the radar source?

Here's the equation you'll need to answer that :

```
                     1 - (u/c)          c = 3E8 meters/second
     v' = v * -----------------      v = radar freq (10E9 1/second)
                               2        v'= return signal's freq
                 sqrt(1 - (u/c)  )      u = 100 miles/hr (161.3 km/second)
```

Now that you see how _small_ the doppler shift is, has reality sunk in?

The reason police radar works without a calibration oven is that it has the original signal to beat against, yielding a time-varying doppler shift that tracks any drift in the signal.

No, but your post might be. ;-) And although I kept the original distribution list, please no further followups to the rec.auto groups!

This does, as the prescient (and totally bizarre) choice of cross-posting groups suggests, originate with drag racing in the 50s. Could go back further, since leaving a trail of burning smoking ground behind was an indicator of speed in early cartoons. Need to extend the cross post to include some cunning linquists if you want a definitive answer.

It was a common saying in the 60s to suggest any form of superiority related to speed or quickness -- physical or mental. More recently, it was the nickname of "Smokin' Joe Frasier", the boxer.

>why not say: "Im your nuts and your my honey and nuts" ,"Cherioos"

Zippy might say this, but he would want BOSCO SAUCE on his nuts.

Greetings to all OM, and YL.

The Hoddesdon Radio Club will be running a special event station in aid of Wood Green Animal Shelters from 2300Z (0000 Local) Friday, August 26 through to 1700Z (1800 Local) on Monday, August 29.

We expect to be operating on HF (80m - 10m), 6m, and 2m.
If you want to arrange a sked with us, please send mail as follows :-

Packet

G7OBS @ GB7DAA.#33.GBR.EU
Internet
hrc @ imcldn.demon.co.uk

We expect to have a small contingent from USAF Alconbury on hand, so I am sure any Stateside QSO's would be welcomed. Callsigns to look out for are GB2WAS on HF, and GB1WAS on 6m & up. Special QSL cards are available for working these stations.

Hope to meet you on the band

73's Mike G7OBS
Contest Manager

Hey Fernandez, If you're going to post drivel like this, at least drool in the right newsgroup. This is *not* the first time you have done this, and you have been warned about this (not by me) before. Why is it that *all* your posts are directed to alt.2600, alt.drugs, alt.drugs.chemistry, rec.autos.rod-n-custom, rec.ham-radio, and rec.autos.driving?
It really is quite inconsiderate, so please stop this activity.
Thank you.

Be careful. For pilots, the FAA allows local authorities to take
action against
errant pilots even though they are licensed by an agency of the Federal
Government.
True, the FCC is a different Federal Agency, so this may not apply. On
the other
hand, have you read the fine print in the R&Rs recently?

rec.radio.amateur.misc:14456

Radio monitoring is, as we all know, a fascinating hobby whether it is shortwave listening or to higher frequencies on a scanner. However, its often difficult to know where to listen for specific kind of traffic or to identify what you're hearing. The SW broadcast area is well covered by the WORLD RADIO HANDBOOK, RADIO DATABASE and other publications and the utility bands have the GILFER and KLINGENFUSS guides. However, the scanner buff has a bit of a problem. Due to the fact that most of the VHF-UHF bands are pretty much line-of-sight, reference materials have to be regional in nature. Those scanner listeners who are lucky to live in certain areas like New York City, Boston and other large Metro regions have access to the SCANNER MASTER publications and there are, of course, specialized materials such as books covering the Aeronautical bands available. THE MASTER FREQUENCY FILE by James Tunnell and Robert Kelty (TAB Books Division of McGraw Hill, ISBN 0-8306-4131-9 $29.95) is one of these reference materials which covers U.S. Federal agencies all across the country.

THE MASTER FREQUENCY FILE is an awesome compilation of frequencies, callsigns and user IDs on the 25MHz to 2110 MHz radio spectrum and makes it easy to find and listen to communications from hundreds of sources including:

- The Federal Bureau of Investigation (FBI)

- Drug Enforcement Administration (DEA)

- U.S. Secret Service (USSS)

- U.S. Customs Service (CUSTOMS)

- Internal Revenue Service (IRS)

- Immigration & Naturalization Service (INS) and the Border Patrol

- U.S. Marshal Service

- National Park Service (NPS)

- Alcohol, Tobacco and Firearms (ATF)

- Bureau of Prisons

- Federal Communications Commission (FCC)

and a whole lot more.....

THE MASTER FREQUENCY FILE is national in scope and organized by state.

Also included are state maps showing counties, some simple BASIC computer programs, a discussion on secure voice communications and a master resource file. This is a list of a variety of specialized sources, publications and recources around the world ready to assist the radio hobbyist or professional in finding that specific organization, fact, facility or product that is difficult to locate. This also lists U.S. military installations worldwide and a compilation of international Aerospace, Security and Defense exhibitions arranged by month.

THE MASTER FREQUENCY FILE is a bit expensive at $29.95 but well worth it if you are into monitoring Federal radio communications. Authors Tunnell (also author of LATEST INTELLIGENCE published by TAB BOOKS) and Kelty have done an excellent job of organizing this wealth of information into a ready reference work where the answer to your question can be found quickly. In my opinion the master resource file (which is over 125 pages of contacts) is extremely valuable and more than adequately justifies the $30.00 price tag.

Michael Crestohl KH6KD/W1

REVIEW: SCANNER MASTER MASSACHUSETTS COMMUNICATIONS GUIDE, 5th Edition
EDITOR: Edward Soomre N1BFF Editor & Publisher: Richard Barnett KA1PYJ

A complete resource of public safety operations and one-and-two-way communications in the Commonwealth....692 pages...ISBN 0-939430-25-8 available from SCANNERMASTER PO Box 428, Newton Highlands MA 02161.
Tel: 1-800-722-6701. Price: $29.95

The ever popular MASSACHUSETTS SCANNER MASTER has been completely revised and the Fifth Edition, published in December 1993 is now available. There have been many changes in the two-way communications scene in the Bay State and the SCANNER MASTER has undergone a timely overhaul to keep up with them. The biggest change was to the State Police - last year state-level Metropolitan District Commission Police, Registry of Motor Vehicle Police and Capitol Police departments were all merged into the State Police. Since each had its own separate radio communications system this was changed to accomodate the new, larger Massachusetts State Police. The 5th Edition features a special State Police section with 30 pages of incredible detail on their new 800 MHz system and was written with the assistance of most of the senior state public safety radio managers.

The SCANNER MASTER is produced for the scanner and radio hobbyist and is an invaluable reference source for beginner and seasoned veteran alike. Many technical matters are explained and there are photographs of major dispatch centers, illustrations, organizational charts and plenty of maps. Also included are profiles of several of the more important "movers-and-shakers in Massachusetts communications. Some of the other "goodies" you will find are complete, VERIFIED ham repeater listings from information supplied directly by regional frequency co-ordinators, a huge new Federal section with FBI, DEA, Customs etc, great railroad, MBTA and airport detail and updated Notification Net information with the Metro Radio Syatem codes and frequencies.

Probably the most innovative technology in the comunications business is the new 800 MHz trunking system. The SCANNER MASTER has a section on how to monitor trunking and has a complete listing of all 800 MHz trunking business users. Other frequency guides list all trunking users at 806.10 from the FCC data. SCANNER MASTER researchers have taken considerable time and effort to look up the SMR callsign of EACH 800 MHz user (and they really have to dig for this!) and can accurately correlate this data to determine which repeater is being used so the listings in this category can be more specific and accurate. EVERY business license in the state is listed including the new 220 MHz narrowband licensees.

The SCANNER MASTER is broken down into five major sections. The first 185 pages describe in great detail the functions, jurisdictions, equipment and radio usage of every state, county, federal and regional agency, including State Police, Mass Highways, MEMA, MWRA, Massport, MBTA, marine, Coast Guard, aviation, news media and a lot more. The Community Section provides an alphabetical listing of every community in the State along with ALL radio licensees, including PL tone code information where applicable. Information on police usage is extremely detailed - including roll-call times, codes, station/unit identifiers, maps, charts, etc. The New England Public Safety Frequency Sort includes ALL police, fire,ambulance/EMS, municipal service listed in frequency order (to assist you in identifying what you are hearing). The Business Frequency Sort section lists all non-public safety agencies in frequency order and finally, the Business Type Sort lists all businesses in the guide in alphabetical order. Unfortuntely, due to space limitations the popular fire department and community profiles sections had to be left out of the Fifth edition.

There is so much more to this book. It is an invaluable reference but, more important, it can be read like a book and is packed with a lot of good reliable information. I an fairly new to scanner monitoring but my 4th edition of the SCANNER MASTER provided me with a good foundation of knowledge. The Fifth edition contains so much more timely and up-to-date data to make the hobby more fascinating and enjoyable. I've looked at the other books available in this area and the SCANNER MASTER is THE best reference source. Anyone can get the raw F.C.C. data, but editors Soomre and Barnett have done an excellent job of explaining, clarifying and amplifying the information which is something the others have failed to do. I highly recommend this book to scanner enthusiasts in the Commonwealth.

SCANNER MASTER produces guides for other areas as well and in the next few weeks I hope to examine some of them and report my findings. But, if they are of the same caliber as the MASSACHUSETTS GUIDE I can tell you now that they're going to be great!

Review: TUNING IN TO R.F. SCANNING - from polic to satellite bands
Author: Bob Kay - TAB Books Division of McGraw-Hill Inc. 1994
ISBN: 0-07-033964-3 $14.95

This short book (150 pages) is an excellent guide for beginners to the fascinating world of scanner radio monitoring. It is well written in an informative style and addresses the main questions and issues of concern to someone with little or no knowledge of the subject.

The first chapter is devoted to information and advice on selecting the proper scanner to suit the listener's needs. Authou Kay explains the terminology and what the various specifications mean in everyday language. In addition, he covers the different controls, functions and features of today's popular scanning radios. The second chapter covers the different types of antennas, installation and most important, advice and warnings on the subject of lightning. Chapter three deals with coaxial cable and connectors.

The book changes focus with the fourth chapter which is entitled Rules and Guidelines, and covers subjects like the radio spectrum, frequency spacing, false frequencies such as birdies and images, simplex/duplex transmissions, repeaters, narrow and wide-band and the differences between AM and FM. Chapter five is devoted to scanning legalties, including the Electronic Communications Protection Act of 1986 and state laws that govern scanning radios.

The final chapters covers popular monitoring targets such as amateur radio, baby monitors, business communications, news media, railroad, fast food (no kidding!), aircraft, cordless microphones and telephones, fire, Medivac, military, ship-to-shore, police and Federal law enforcement, outer space and sports teams. There's even a section on monitoring the President.
The chapter on frequency listings contains a wealth of frequencies for the novice to explore, and tips and advice on how to search. There's a section on computers and scanning, clubs and magazines with a detailed listing of addresses and contacts. The book concludes with a question and answer section and an index.

I was impressed by the amount of good information packed into 150 pages and would not hesitate to recommend this book to anyone who has become interested in monitoring the VHF and UHF radio spectrum or has just received or purchased a scanning radio. I only wish TUNING IN TO R.F. SCANNING had

been available when I first became interested in scanners It would have
saved me a lot of time.

Hello, Can anyone tell me how to get in touch with the owner of Revenna?
He is a Radio Ham operator, and also makes rocket motors. He and his
wife are Hams. I think they live in the Illonois area. Thanx

Jon

I'd much prefer to sell these locally, to avoid hassles & delays from mailing the items. Local means Boston area.

For Sale:

1) Icom IC-2SRA handheld transceiver $400
    - receives 25-950 MHz
    - includes cellular range (unmodded)
    - transmits 2 meter band (140-150 MHz)
    - transmit strength .5, 1.5, 3.5, 5 W
    - AM/FM/WFM bands
    - 63 memory locations
    - 9 hour continuous use (scan mode) battery
    - includes manual, schematics
    - AC adapter (standard type) not included

2) Radio Shack Pro-37 handheld scanner $150
    - receives 30-54, 108-174, 380-512, 806-823, 851-960 MHz
    - includes cellular range (modded)
    - 200 memory locations
    - takes 6 AA batteries, built-in recharger
    - includes manual
    - AC adapter (standard type) not included

E-mail me with a phone number if you're interested in either one.

Would anyone happen to have a schematic for a low power VHF-FM micro transmitter? (Or know of a web/ftp site where I could find one?)

Thanks-in-advance.

No Code Amateur Radio License Class
Ham Exam Cram
at
Harper College

With the new FCC No Code Technician Class License, you can participate in Amateur Radio with full privileges at all frequencies above 50 Mhz. This includes repeaters, all of the new digital modes, HAM satellites, and RACES (Radio Amateur Civil Emergency Service.)

As a public service the Electronics Department at Harper College and the Northrop Grumman Amateur Radio Club will hold a one day "HAM EXAM CRAM" course on Saturday May 6 1995. This course is geared to provide you with everything you need to pass the FCC exam. It will make no attempt to go beyond the minimum required by the FCC, hence if you study the 4 pages provided before taking this class, you may obtain your FCC No Code Technician License in one day.

Class starts at 8:30 a.m., a lunch break is scheduled from 11:30 to 12:30, and the exam follows at 4:00 p.m. The fee for the course including the exam is $20.00. Call 708-925-6996 for more information and registration instructions. When you have registered you will receive the four-page handout by return mail. It is NOT recommended that you attempt the FCC exam without advanced study, at least of this review handout. The exam covers basic electrical and radio principles and applicable FCC rules and regulations. The latter are most frequently the stumbling block for those who don't succeed on the exam.

Please copy this notice and post it where it may receive the maximum exposure. We hope to build this program so that it may be run on a regular basis.

Call 708 925-6996 to register.

[I am passing this notice on as it requests... I know nothing more than what is already in this notice. Call the number above or email gdorner@harper.cc.il.us for more information. - Troy]

R. Troy Monaghen "Blessed is the man who finds wisdom, the man who gains

A friend bought the 2 meter (145 MHz) handheld transceiver (HT) from Radio Shack. This HT has the problem of jamming the TV when he transmits full power with a 5/8 wave vertical antenna. I suggested adding a filter to the TV. But it didn't work. I would appreciate any help and suggestion in solving this problem?

Btw, I tried transmitting with my Icom 2GAT (7 watts) with different antennas right next to my TV with no bad affected. I guess Icom is just good with harmonic suppression.

Cheers & 73, Harry/AA2NO

summary: Wanted. A design for a 5KHz LC ocsillation circuit.

Hi,

I'm after a design for a 5KHz antenna circuit, consisting of an inductor and capacitor set up as a tank oscillation circuit. I need it to detect a 5KHz signal. I then want to feed this into an op-amp.

I figure the inductor would be wound on an air core former of about 5mm diameter.

I'm not too good on antenna design so the above may not be the best approach. I need to make the antenna as small as possible.

It is best if you email me directly as I don't have access to all of the groups I've posted to. I'll post a summary of the responses.

Thanks in advance,

Peter.

Radio/Electronics stuff for sale.

Hallicrafters SX-111 Ham Band SW radio for sale. All tube design.
Good condition. $60 firm.

2 Hallicrafters SX-100 radios. Low end general coverage SW radios.
All tube design. $30 for the pair.

1 old tabletop FM radio. Needs filter cap or rectifier tube as the
audio has a loud 60 hz buzz. Very unique cabinet design. Red Plastic,
Emerson. $30 firm. Very Good condition.

1 old tabletop AM radio. Needs tuner string rerun. Works fine.
Unique cabinet design. I believe bakelight. $20.

Large number of tubes in boxes. Approx. 200+. $100. Many common such
as 6au6, 12ax7, etc as well as oddballs.

HP power supply. Model 6246 0-20v, 0-20A. Does not adjust below 10V.
$50.

0-450V DC power supply. Good condition, works perfect. Do not remember
the brand off hand but if interested call and I will look it up.

Tek 3a6 vertical sweep plug in. $12.

Please respond via return email or call 708-931-4880. All items
are cash and carry, and are located in Elgin, Illinois.

Never did get my general licence. I've been waiting these past 20 years for old
style techs like myself to be grandfathered in with the generals. Hmm.. maybe
I should start a NYC naturist net on VHF or UHF? Nahh... it would probably be
an awfully quiet net.

My goal is to reduce interference (intermodulation, etc.) from
signal sources outside the radio frequency band of my receiver.

My receiver works in the 140-150 MHz range. What sorts of commercial bandpass filters are available? What kind of selectivity can I expect? What kind of loss? Are the filters already set up for the 50 ohm input of my receiver/coax, or will I have to impedance match? Is impedance matching necessary?

Please avoid answers like: 1) you can use a cavity (I know that), 2) you can use an inductor and a capacitor (yea), 3) you can use a helical resonator (uh, huh). Answers like:" Toko Hi-power makes helical resonators..." might be of some use, but only a little. Rather, I am looking for specific details on parts, applications notes, and actual experience in using such a device.

For all who respond thoughtfully: thanks.

I have for sale or trade a just-under year old ICOM IC-735. It has had VERY VERY little use -- I'd safely say it was under 10 hours TOTAL usage time. It is in new condition, not a scratch! Comes with original boxes, manuals, everything! Just plug into a power supply and let it rip.

It features:

- Compact Size
- All band
  Every amateur band from 160 meters to 10 meters FM. Also covers the CB band (11 meters).

- All mode
  Handles Upper Side band, Lower Side Band, AM, FM, RTTY, AMTOR, SSTV, CW, etc.. you name it, it handles it.

- Fully solid state
- General Coverage Receiver covers from 100kHz to 30Mhz continuously.

- 105dB Dynamic Range on RX
- ICOM's Direct Feed Mixer (DFM)
- Pass-Band Tuning
- Notch Filter
- Pre-Amp Included
- Attenuator Included
- Rotary dial digital tuning
- 4 scanning modes
- 12 frequency/range memories
- Easy to read LCD backlit display
- Dual VFO's
- 100% Duty Cycle at 100 watts!
- Advanced cooling system provided
  It has a multi-speed internal fan that automatically changes speed according to internal temperature. In other words, it regulates internal temperature quietly, and efficiently for optimal component life span.

- Advanced Remote Control System
  With a computer, you can control just about every aspect of the rig with the included CI-V interface.

- Rated at 100 watts on all modes, however easily can achieve 125 watts.

I a selling it because I am going to be in a college dorm next year. As we all know, HF gear is taboo. I purchased it mid last year for $950.00. Since it is in excellent condition, and has seen very little use, I would like to sell it for $725.00 or best offer. I'll pay shipping to anywhere in the US.

See the next posts for some other ham gear that I
have for sale. I will be willing to give a discount to
some one who wants multiple items.

Thanks,
Seenu

Why is HF gear taboo? One of my classmates worked 10m HF from his 6th floor
room with no hitches (late seventies, Tulane Univ). Are administrators
causing a ruckus these days?

At cornell they are afraid that the RF will interfere with their computers, tv's, etc.. I
think that I could get away with an HT, and thta is about it.

Thanks,
Seenu

For about the last two weeks I've been listening for Mir without sucess.

Does anyone know the status of the amateur radio abord the space station?

Is there a gateway that forwards email between the Internet and
packet radio? If so, what's the mail address syntax? Thanks.

Here's one I saw earlier:

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.

No files should be sent.

(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com -or-
Fidonet : David Dodell @ 1:114/15

(5) Have fun. Use the gateway as much as you like. That is what it is there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address, proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@stat.com

-----
73's De Jason Turning N6WBL
Internet : jturning@netcom.com
AX.25 Packet: N6WBL@KD6XZ.#NOCAL.CA.USA.NA

I use the n0ary gate and BBS. Not only can you send email but you can also participate in bulletins or any other BBS function. It is really cool. Here is the whole file ... the author's address is at the end.

----------------(cut here)---------------

There is an error in the "73" magazine article. If you are an internet only user the action of registering you automatically enables email forwarding. You do not need to perform the "Enabling" step.

N0ARY/BBS Internet Gateway Operating Instructions
August 7, 1992

LOCAL USERS:

Local users are those that log into the bbs via the bbs's telephone modem port (408-749-1950) or via one of the 3 tnc ports (144.93, 223.62, 433.37). Each local user has a bbs account that is used to customize how the bbs interacts with the user.

Local users can set their account up so that all incoming mail addressed to their call will be forwarded via a gateway to internet and on to other networks (mcimail, compuserve, etc). All the user needs to do is enter his email address and turn the feature on.

```
  EMAIL bob@hal.com
  EMAIL ON
```

When the EMAIL feature is turned on the packet message will be deleted at the time of forwarding through the gateway. So care should be taken that the paths are correct prior to turning the feature on, for instance enable it, send a test message, and disable it. After a successful transfer re-enable the feature. To disable the auto forwarding feature simply type:

```
  EMAIL OFF
```

Messages can be sent by packet users to the internet users via the gateway. This applies to users at N0ARY as well as users at other bbs's. Begin by sending a message to IPGATE@N0ARY with the first line of the message being the letters "To:" followed by the internet address of the recipient.

```
  N6ZFJ de N0ARY >
    sp ipgate@n0ary
  Enter your subject:
    Meeting?
  Enter your message body:
    To: bob@hal.com
    Are you planning to attend the club meeting on Thursday? Give me
    a call. 73, Connie
    ^Z
```

NOTE: That the recipient cannot respond to the message unless they are a ham and registered with the gateway. He/she becomes registered by sending a message from his internet host to gateway-request@arasmith.com.

REMOTE USERS:

Remote users are those that do not log into N0ARY directly but merely appear from the packet world to use it as home. If a packet user checks the "White Pages" for a remote user the entry comes back as @N0ARY. The packet user then address his message to YOURCALL@N0ARY and the bbs will do the translation and forwarding to internet.

It is not necessary for a person to know your actual internet address nor use the SP IPGATE method described above. From the packet network it appears that you are just another user at N0ARY.

WHITE PAGES:

The "White Pages" is a distributed database of all the bbs users. Most bbs users in the US are represented in the database as well as many from other countries. When a user chooses a home bbs, that bbs generates an update that is sent to the regional servers and then distributed to all the other bbs's. An entry consists of; call, home bbs, first name, zip, city and state. When a user wishes to send another packet user a message he/she consults the white pages (WP) for the home bbs.

REGISTERING:

Before a user, both local and remote, can send a message from internet into the bbs system he/she must register with the gateway. This is done by sending a message from the host that he/she intends to use to gateway-request@arasmith.com with the following information:

CALL:
FIRST NAME:
CITY & ST:
ZIP:

When a request is received the "From" field is copied directly into a file with the requesters call. Whenever the gateway receives a message bound for packet it scans this file comparing on the "From" field. When a match is found the gateway uses the associated call from then on. If there is no match the mailer bounces the message with a one-liner indicating the the user must register.

If you currently use another bbs as home this needs to be stated in the request. Otherwise you will be assigned N0ARY as your home. If you choose not to use N0ARY as your home you must make sure people know to send your message to YOURCALL@N0ARY to pass through the gate. Your WP entry will be wrong.

EXECUTING BBS COMMANDS REMOTELY:

Many of the commands available to local users is also available to remote users by sending a message to the bbs. Here is a subset of the commands currently available.

LIST	listing messages
LOOKUP	look up calls in the on-line callbook
WHO call	dump a users account information
READ	read messages and files
USERS n	display the last n users to connect to the bbs
INFO	display manual pages of various topics
CD	change directories in the file system
LS/DIR	display the contents of a directory
WP call	look a user up in the "White Pages"
HELP	get help on how to use a command

Not all commands available to local users can be accessed via the gate. All interactive commands are disabled as well as commands that modify the users account.

The command parser for the bbs is very powerful and the user can form very complex requests. For instance the following command is valid on the bbs:

```
LIST LAST 20 BULLETINS FROM N0ARY
LIST ALL BULLETINS ABOUT KENWOOD
```

The ABOUT keyword is used to search the subjects of messages for a given pattern, in this case KENWOOD. It can appear anywhere in the subject line.

This is an example of how complex all the commands can become. They can also be abbreviated down to the level understood my most other bbs programs. Any of the following will give the same results.

```
  L< N6ZFJ
  LIST FROM N6ZFJ
  LIS < N6ZFJ
  L FR N6ZFJ
```

In most cases a minimum number of unique characters is needed to distinguish a command.

You can get a list of commands and a translation chart from W0RLI to N0ARY by typing the following commands.

```
  INFO COMMANDS
  INFO W0RLI
```

Other commands that you may wish to execute are:

```
  INFO MANUAL
  HELP HELP
  HELP LIST
```

Now that you know what some of the commands are this is how you go about executing them. You send a message to cmd@bbs.arasmith.com with your commands entered one per line or separated by semicolons. For example if you want to know if three of your buddies are in the white pages and if the bbs has any messages about the ICOM W2A.

Send to:
  cmd@bbs.arasmith.com

```
  Subject: you can put anything here
  wp n0ary n6zfj n6une
  list all about w2a
  .
```

The bbs will execute the commands and respond to you via return mail.

SENDING MAIL TO PACKET:

Once registered the user is free to begin using the gateway to send messages from his host through the gateway into the packet world. How much you have to specify of a users address depends on how much the bbs already knows about the user.

If the bbs knows the home bbs of the user and his home bbs is know to the the N0ARY bbs, which most of them are, you simply need to supply the call.

n6zjf@bbs.arasmith.com

If the N0ARY bbs doesn't know of the user but does know where his home bbs is then you need to supply just the home bbs call in addition to the users.

n6zjf%n6qmy@bbs.arasmith.com

Notice that the call and home bbs are separated by a percent sign '%' rather then the '@' which is used in the packet domain. This is because the '@' has a meaning in the internet address.

If the bbs has no knowledge of either the user or his home bbs then you probably have the wrong home bbs or it is a new bbs. In which case you will have to supply the full address so the bbs will know how to route the message.

n6zfj%n6qmy.#nocal.ca.usa.na@bbs.arasmith.com

This level of addressing is hardly ever needed and normally means that the home bbs is in error.

Bulletins can be sent in a similar fashion. The address is made up of a keyword, which can be any six character word and a distribution. Distributions are local to an area. For instance SBAY is valid in northern CA, it probably has no meaning at all in Topeka, KS.

Valid distributions are:

ALLUS	please avoid this one
ALLUSW	all western US
ALLCA	all California, any 2 letter state should work

So if you trying to find a cw filter for a Kenwood TS440.

Send to:
want%allca@bbs.arasmith.com

Subject: Kenwood TS440, CW filter
If you have one of these you are willing to part with please
give me a call or leave message, thanks.
73, N6ZFJ@N0ARY.#NOCAL.CA.USA.NA
.

Be descriptive, brief, and always include your full return address in the message. Also please try to limit your distributions to small regions. Using the ALLUS distribution really slows down the flow of messages.

INFO ON THE N0ARY BBS:

The bbs came into being in July of 1990 and as of July of 1992 had over 600 users, 500 registered as home. The bbs has 3 rf ports, 2 phone ports, the internet port, and a voice synthesizer port. The latter allows users to check for messages via DTMF from their handhelds.

The bbs itself runs on a Sun workstation under Unix. The code was written by Bob Arasmith to focus on the user. Great care was taken to make the bbs very forgiving to the novice user but very flexible and powerful for the old-timer. The bbs can be configured to interact with each user differently. Some examples are:

* List messages in either descending or ascending order.

* Specify a list of keywords that the user wishes not to see displayed when a list is performed, similar to a kill file.

* .signature and .vacation files.

* Specify how many lines the users terminal is capable of displaying before scrolling, the bbs will feed info this many lines and pause allowing the user to catch up and continue or abort the operation. Similar to more.

* Users can put commonly executed commands in keystroke macros that are accessible via a single keystroke.

A manual is currently available describing the commands and their permutations. This manual will be available in late 1992 as a postscript file. Run the command INFO MANUAL to learn how to get one via the post office. It is not available in an ascii format.

If you have any questions about the internet gateway or the bbs in general please drop me a message.

73, bob
     n0ary@n0ary.#nocal.ca.usa.na

I've a friend who is trying to learn about EM fields
measurement and shielding. If you have any recommendations
of texts on the subject, or have experience in this area
and could answer a few of his questions, you could really
help out a newbie to the field (no pun intended :). He's
interested in the 'whole enchalada', ranging from ELF to
microwave. He's bright and eager, so *please* drop him a
line! He doesn't yet have internet access, so please
e-mail him at:
           71051.3051@compuserve.com
or follow up this post and I'll pass it along to him.
Thanks for your time and help!

Alan
acooney@netcom.com

BTW, his name is Rick. Thanks again!

```

Hi all;

Just got my basic certification yesterday and am now in the market for a handi talki with the goal (once cash flow improves) of getting into packet.

Shopping around Ottawa, I have narrowed my selection down to two units:

1) ICOM IC-P2AT 2m band @ $375 canadian; and
2) ICOM IC-24AT 2m and 440 @ $460.

I am really new to all this and would like some advice on how I should proceed. Is the addition of 440 worth 85 canadian (aprox 43 cents US ;>). Any general comments about these radios?

Please remember that the untimate goal is to set up a packet station and also to have some fun with Satelites.

73 de VE3XMJ (Dave Mercer)

PS. If there are any packeteers out there from the Ottawa area, I would love to hear from you.

I have a question about recharging "Millenium" NiCad batteries. Sorry for the cross posting but I think it is necessary to get a definitive answer.

Facts:
I have used AA NiCads for over a year, recharging them overnight in a Radio Shack "7 hour charger". I previously used a charger which claimed to take 14 hours. I believe they are 650 mah. I have used them extensively with no problem.

I just bought a new charger, a Radio Shack "2 hour charger" that operates with an internal timer.

I just went to the store to buy NiCads in conjunction with a Walkman, a present. The only brand was "Millenium" made by Gaines Energy Products, Florida.

They advertise 33% more capacity. I guess they cram more into the casing.

They (Millenium) advertise 1 hour charge time on the battery package. The Millenium charger claims to charge the Millenium batteries in 1 hour, but claims to take 6 hours for other brands.

What is going on here?
Why do some chargers charge quicker than others?
If just more current, why aren't they all fast?
Is there any harm (wear and tear) using the faster chargers?
Are the Millenium batteries any different than the others?
Do they in fact charge faster?

What is the harm in leaving batteries in the charger longer than required? I plan on charging these the same as the others.

Any answers appreciated.

Howdy...

I've got a Motorola STX Handie Talkie FM radio (w/ keypad).

Could someone tell me what it does?
 (and maybe even where I could get a manual for it?)

Thanks,
 Matt Marjanovic

The Motorola "STX" Handie Talkie is a 3 watt, conventional and trunked 800 mHz transceiver. They were real current a couple of years ago, and my guess (if it works) it's still worth about $500.

Manuals can be had through Motorola (naturally).

Sure do.

Your best bet will probably be ftp.cs.buffalo.edu:/pub/ham-radio/mods

For those still thinking about using ham.eetech.mcgill.ca, don't.
This site is closing PERMANENTLY on 19 November, 1993.  All the mods
which are available at the latter site have been moved to the former.

Buffalo's set comprises, of probably 95% of what's out there in terms
of ftp sites and automated mailers. I am the person one who
collected, and weeded out this collection in particular. There are
over 250 at the present time.

I'm moving in the very near future, but once I've settled down again,

WIBNI we could come to some sort of agreement on having THE mod site
somewhere, so people don't have to go all over creation to find what
they need.

Hello. I'm not suer if this is the right group to post in but it's worth
a try.

I just bought a Mr. Microphone and I was wondering if there is anyone out there
who has had any luck making so adjustments to it such as:

1) Adjust the frequency of the transmission to any great extent (different
   band?)

2) Increase the power output a great deal?

Any ideas would be appreciated!!

thanx!!

Chris

Due to some major changes in my life I am forced to
sell all of my nearly new ham radio gear. All of the
equipment is less than one year old, and was purchased by
me.

Here is the list:

Kenwood TS-690 -	$ 1,075.
MFJ 948 Tuner	$ 75.
Astron RS-35m Power Supply	$ 95.
Kantronics KPC-3	$ 65.
Alinco DJ-580 Dual Band HT	$ 275.
MFJ - 1796 multi band vertical Antenna	$ 100.

You can reach me by phone or e-mail.

After my post for info on Spread Spectrum this
is a summery of the info I got. So anyone else who wants to
play with SS can.
I had many request for the info I might get, so I think it would be
nice to put it here.

Thanks to all who sent me info.

A group meet in Redwood City on the second Wednesday of the month.

You might consider subscribing to "Spread Spectrum Scene" published
by Randy Roberts, KC6YJY.   You can get hold of him at 415-726-6235.

Tell him "Steve" sent you ;-)

Steve KA6S

I'm also interested in spread spectrum applications, primarily for data communications. One place to look for information is the ARRL Spread Spectrum Sourcebook. It has construction projects as well as a lot of information on the technology and capability of SS systems. It also covers the legal aspects of SS operation.

I'm thinking of coming up with an SS data transmission scheme that would use the entire bandwidth of an OSCAR transponder -- at a power level just above the noise floor -- for a 56kb data link.

If either of you gets more information, add me to your list of interested parties.

Thanks,
-- Bruce Toback
KN6MN

See Electronics World + Wireless World "Voice link over spread spectrum radio" by James Vincent G1PVZ. This series began in Sep 93 issue describing a complete Direct Sequence system from microphone to the antenna (435 MHz) and from the antenna to the loudspeaker.

The classical reference is "Spread Spectrum Systems" by Robert C Dixon, ISBN 0-471-88309-3 (2nd edition 1984). This book is quite readable compared to many other scientific books.

Paul OH3LWR

In a previous post, Marc Lombart (ranfry@CAM.ORG) wrote:
:   My knowledge of Spread Spectrum is quite limited, but my
: understanding is that it would probably not be viable as a HAM node,
: seeing as it takes many times the normal bandwidth for each "channel."
: The main use of Spread Spectrum is security, not communication. At
: least, that is what I know from the little I have found on the subject.

Security depends on the algorithm you use to "spread" the signal, so you can make it pretty public if you want to. (I think current FCC rules limit ham useage to a few well-known algorithms.)

As far as my limited understanding goes, the main advantage is coordination: a set of well-coordinated and efficiently-used conventional channels are more efficient of spectrum space than spread spectrum, but you can throw a bunch of spread-spectrum users into a band with *no* coordination and do almost as well. It really pays off when users start moving around or coming and going with no warning. That makes it ideal for consumer applications, the advantages for hams are less clear.

The ARRL publishes a book on the subject that is supposed to be a pretty good intro.

You might try sending calling TAPR (don't have their address handy). I think they were experimenting with some 900MHz spread spectrum packet stuff in Southern California... some sort of wide area high speed net, I believe.

Hi, there are a number of ways to genarate PN codes. One way is to just write a program that generates random numbers each between 0 and 1 (or -1 and 1) However this does not satisfy some of the conditions that the PN seqs must meet in a (rather) realistic environment.

So another way is to use m-sequences, which have well-defined correlation properties. But the problem here is that you can only genarate that many different seqs for a specific number of shift registers. In other words the more m-seqs you want the more (hardware or) software you have to write to generate them.
Finally another way, is to use Gold sequences, which basically is a combination of m-seqs. With this method you can generate even more PN seqs with only a few additional lines of code. All of the above has been implemented before, and I amsure you'll find a lot of material.

If you need more information, about books, papers (on Spread Spectrum) and even the code let me know.

regards

>units with simple TTL blocks so you'll understand what's happening.

There are other references kicking around, and for a completely up-to-date one, see if you can track down the September and October 1993 issues of _Electronics & Wireless World_. The September issue has a very good overview of spread spectrum (concentrating on direct sequence), and the October issue has construction information on a 435 MHz direct sequence spread spectrum system. The articles were written by James Vincent, G1PVZ.

In typical spread spectrum fashion the transmitter is (relatively) simple, while the receiver is quite complicated. It uses some very interesting techniques for acquiring and keeping correlation, and does not need an external reference like some of the stuff in the ARRL spread spectrum book...

Just in case, no, I have no connection with E&WW, or with Reed Business Publishing. I have no idea who Mr. Vincent is, though I do like his style.

73 from Burnaby
laura VE7LDH

I recall seeing "the Spread Spectrum Sourcebook" as part of an ARRL literature ad in a recent QST. I am aware of at least one newsletter devoted to this, and I seem to recall that there is a recent commercially-available amateur product that is a Spread Spectrum modem/radio. Sounded neat - think the creator was in AZ, but could be wrong.

Me? I haven't seen/done spread spectrum since I was a satellite jock in the USAF back in the seventies...

Neat stuff, though.

I am looking for a WWV shortwave or GPS receiver which outputs a TIME format (ASCII, etc.) to an RS-232 interface priced under $2000. This would be for international use, so WWV shortwave may not work very well. Modem'ing to WWV has also been ruled out. Also, I doubt that LORAN would provide sufficient international coverage. Please tell me the phone numbers and/or addresses for the catalog/sales departments for likely manufacturers.

here's what i have:

Check out the LOWRANCE GPS receiver. $599 according to their advertisement in GPS world. Interface is NMEA0183 or RS232. Time Mark is +/- 1 microsecond.

for more details:

LOWRANCE
12000 E Skelly Drive

This telephone number here is not correct. I contacted Lowrance at
918 437 6881 and was informed that they no longer manufacture this device.

I wrote a program to run on a PC (actually an HP Palm Top) for someone
that has one of those Lowrance receivers. The Ascii data that is
sent out the RS232 port although decipherable, is not in a normaly
human readable foramt. It is in the NMEA0183 standard format which is
a comma deliminated string with the first characters denoting which
string of data you are looking at. The string is about 50 to 60 character
s in length and contain lots of other information besides just the time.
Only data, nothing like hours, minutes, etc. You get 2 data strings every
other
second on alternating seconds both of which contain the time. But I'm
not sure if you get the time to the microsecend resolution in these strings
or not. (I don't have the manuals in front of me) There are several other
strings of data that you can request by sending the receiver a request in
an ascii string. I guess my point is that you will need some kind of
computer or at least a microprocesser to crunch the data and display it
in some kind of meaningful way. Lowrance provides a demo program, but
it didn't meet the amateur radio needs of the fellow I wrote the program
for. (Grid Squares, bearing/distance to other points on the planet, etc)
Hope this dribble is of some use, I just didn't want you to think that
for $599 you were getting a complete, turn-key system. . .

RS232 eh? Let's see -- characters come into the receive buffer on the UART at a rate of 52 microseconds per character (assuming 19.2 KB) and then sit there for some number of microprocessor clock cycles before they are read from the buffer by the micro. Of course, it takes multiple characters to get the time --- there goes your one microsecond accuracy!

Unless of course you do something like connect the data signal to the
Carrier Detect pin, and then arrange for your kernel to detect the first CD
transition, latch the current time, and disable the CD code.
At leisure, a program can then make an IOCTL call which reads the last time CD
timestamp, and re-enables the CD code.

The higher end Novatel receivers have a TTL strobe that can be used
for this purpose.

I took the information home but the unit described here also has the
same type of setup.
Watch for the strobe, Read what time it was, Calculate any error, Update
your timebase.

Date: 27 Jan 1994 11:26:37 GMT
Organization: Helsinki University of Technology
Lines: 25
Distribution: inet
Message-ID: <2i88dd$ecp@nntp.hut.fi>
NNTP-Posting-Host: beta.hut.fi

There are dozens of stations around the world transmitting weather maps
using an analog facsimile technique. Anyone with a good enough radio and
the necessary hardware and software can receive and view these maps.

A few days ago, I released a shareware program that allows a Macintosh
with built-in sound input and color quickdraw to receive these maps
and diagrams in 16 shades of gray.

The program is available with anonymous ftp from sumex-aim.stanford.edu
and was archived as: /info-mac/comm/rad-fax-09.hqx

The shareware fee is $25 and I will send Think C source code to those
who send me the shareware fee. All you need a Mac with a microphone or
the attenuating cable. (I have mostly used the microphone, since
connecting a cable from the Mac to my radio adds a lot of noise to
the signal.)

Maps typically include the current weather situation at different
altitudes and forecasts. The about box of the program includes a
tiny fragment from a map that I received. (Showing Iceland and
parts of Scandinavia.)

I have been receiving mostly Russian maps and those are mostly hand drawn over
photocopied maps and I suspect that the transmitting analog fax machine hasn't
even heard of computers. This technology is old and dates far back.

Is 'GPS world' a magazine??? If not, what is it?

I have a Trimble FliteMate GPS receiver that I use for trail survey work,
and I'm interested in all things GPS. Any help with info on where to look
would be appreciated. This newsgroup is the only place I've found GPS

mentioned.

Thanks,

For Finland you could try:

```
1877.7 kHz (OFH)  2804.7 kHz (OHG)  2811.7 kHz (OHG)  8018.0 kHz (OFB28)
```

Probably Meteo Bracknell in London is a lot more interesting:

```
3289.5 kHz (GFA21)  4610.0 kHz (GFA22)  8040.0 kHz (GFA23)  11086.5 kHz (GFA24)
2618.5 kHz (GFE25)  4782.0 kHz (GFE21)  9203.0 kHz (GFE22)  14436.0 kHz (GFE23)
```

```
I don't know, wether all the frequencies are still correct.

The modulation is usually F3C. The analog data format is called WEFAX.

Sincerely, gero.

Yes, GPS WORLD is a magazine with Editorial Offices in Oregon/USA.
(503)-343-1200

(Subscriptions (800)949-6525 - and I am in no way associated with
the magazine - just read it once in a while.)

The January 1994 issue has a special survey section on GPS Receivers.

X-Newsreader: Trumpet for Windows [Version 1.0 Rev A]

Hey everyone, I am looking for some information on how to retune the channel elements for GE Master II radios. (I guess these channel elements are also referred to as "ICOMs" i.e. they have the word ICOM written on top of them, anybody who is familiar with these knows what I am talking about.) Anyway, I want to order crystals for these things and retune them myself, rather than sending the channel elements in to be recrystalled for me. (I am hoping to save some money.....) I am hoping that someone out there can fill me a little bit more on how these things are tuned. I know that there are several small parallel lines on the back of the circuit board that are supposed to be used for varying the capacitance, but am not sure of exactly how to go about this. I don't want to have to cut and resolder one by one to see what happens... Looking inside the units that I have, none of these lines have been cut, they are all connected...   Anyway, any help would be appreciated!!!

Thanks in advance!   - JON

I am interested in purchasing an HT would like some advice as to what are good models and the costs I am likely to run into. I plan on also using the HT as a scanner, so it must be able to pick up local police, fire, etc. as well as aircraft frequencies. I understand many HTs can get these frequencies but they need to be "modified" before hand, about how much does this cost? I have heard of dual-band HTs but am not totally sure as to what this means -- any helpful comments? One other consideration, I guess I might as well get a fairly powerful model as well (5 watts?) -- additional options (like getting cellular frequencies, a keypad with hundreds of features are nice, but not necessary. Where is the best and cheapest place to get such equipment? Also willing to buy a used model. Please email any responses.

Thanks in advance,

Marc Wollemborg

Summary: Request for Control Tower Frequencies for San Francisco International
Keywords: airport frequency san francisco

I'm going to be visiting San Francisco in the next couple of days, and I would like to get the control tower frequencies for the San Francisco International Airport. Unfortunately I don't have the "Police Calls" book for the Western USA, and I can't pick one up at the local Radio Shack (I live in Alabama).

If someone out there happens to have these frequencies, I'd sure appreciate it if you'd e-mail them to me. I'm taking my HT, and since I'll be staying close to the airport, I'd like to tune in while I'm there and listen to what's going on.

Thanks in advance.

Gentlemen,

I seeking businessmen or companies, which want to find dealers of CB or HF equipment in Russia, or open representatives here.

If you have some interests in this business, I'd want to discuss this problem with you in direct E-mail.

With best regardings,

Andrej N. Mikhailov "Andy"

Andrej, Uniden of Japan is supposed to make about 70% of the world's CB/11 meter radios, so hopefully you can find an address for them.

For your section of Russia, which 11 meter frequencies and what transmission modes & power levels are legal?

A few years ago, a Southern California CB store owner told me that he had sold quite a few illegal CB radios (which covered from 26 to 28 mhz with up to 20 watts of SSB) to Russian fishing boats, that were in port at San Diego. Evidently there was nothing like them available in the USSR in the late 1980's.

73 from Santa Barbara. --Leigh.

I have a Motorola Ht-220 Type CC3540 Serial # L06K2D Model H33FFN1100E. It transmits and Receives on 163.5375 MHz. It has a 15 Volt NiCad. It is crystal controlled. I would like to convert this to 2 meter. Does anyone know how I can do this? I should be able to swap out crystals, shouldn't I?

The numbers on the crystals (as best as I can tell) are:

xmit: 18170.8
rcv: 48912.50

What do these numbers mean and how are they related to the transmit and recieve freqs? There is also a "PL Reed" that I will probably need. What is this? Motorola wants $90 I DON'T THINK SO!. I'd like to substitute with something a little less pricey.

Last (and least?) I need a charger for the Ni-CAD. I'd like to build it myself. Any plans out there?

I live in Columbus Ohio but I travel extensively. I will soon be in the Detroit Michigan area, anyone up there that can help me? Please respond via email as my access to news is erratic.

My email address is:

dmarsh@oracle.us.com

So many questions, so few answers.

Doug N8TUT

these are the crystal freqs in KHz. the xmit crystal is 1/9th the xmit freq.

The recieve crystal freq = (recieve freq - 16.8MHz)/3   The 1st if is 16.8MHz.
2nd is 455KHz.

You'll have to tweak the front end recieve LC circuits some, but don't touch

the IFs. And tweak all the xmit LCs. How to tell apart? You should get
the service manual. Mine refers to H23ff...., so yours may differ some.
You might need to add some tiny caps (both physically and in the pF range)
to get the LCs down from 163 to 146.

There is also a "PL Reed" that I will probably need. What
>is this? Motorola wants $90 I DON'T THINK SO!. I'd like to substitute with
>something a little less pricey.
If the reed is "4A", it may be compatable with the local repeaters. or the
reed circuits could be removed, but there's some small change to make to
the squelch.

As for the NiCads, I wouldn't be suprised that they might be dead now.
I mean not chargable anymore.

I've been using an HT220 board or my packet radio, crystaled on 145.07MHz.
Coupled with a small power amp stage to generate about 8Watts. It's been
going for 5 or more years in this service, and the friend who gave it to
me had it this way (different freq's for voice work) ten or more years
before. It just keeps on going.... We run it off a power supply, and
I'm using a J pole antenna.

Here's a good one for you DX enthusiasts...

I'm trying to get my brother to get the new code free "Communicator's" license so that I and my family can keep in touch more inexpensively (the international long distance telephone rates are killing me).

I'm in Finland and he's in Florida. Because the only realistic DX band he'll have available to him will be 10 meters, I need to figure out what kind of station configuration will work on 10 meters between Finland and Florida.

I'm a newcomer myself to amateur radio, so I could really use some expert advice from some of you DX folks.

What is the minimum functional station configuration for DX phone communications between Finland and Florida on 10 meters??

How much power will we need? What is the 'best' antenna configuration?
What are the best times of the day/year for 10 meters US<->Europe?

From: ed like an "I"

Is someone using my call letters? asks Scott, KA3HZY

I agree with the others that wrote, that your call sign was most likely mis identified; something not too uncommon if it was a DX contact from the US to a nonnative English speaking ham. The "Y" might well have sounded like an "I" to the Dutch station. I seriously doubt anyone was bootlegging your callsign.

This all brought back a flash of memories of the time I thought I caught some one red-handly using my call. It occurred in the Washington DC area, and on 6 meter CW, of all places. I heard a station working a fellow in the Midwest return to a "/3" station (for you new hams that is how we used to have to identify we were outside our original licensing districts) with what I could only initially pick out as MY callsign! I listened to the reply from the "/3" station, a strong local, who gave back

 "...d..e.......K...L...7...G...L...."

By now I was seeing red, a local in the Washington DC area on six meter using a my callsign, I was so sure I caught a bootlegger...
then he sent
              ...L..."   (De KL7GLL)

I turned out we had gotten our lcenses half a world away, almost on the same day and never met until then 20 years later on 6 CW in Washington DC.
Anyone is free to search for the moral here.
                                   Larry Jack KL7GLK / V77LJ

You need something more than 1 Watt and something like a vertical antenna or better. If condx are good on ten, you don't need too much power. If condx are bad - nothing helps.

73,
Rupert

Here in Sacramento, I have found Anderson Power Pole connectors at Metro Electronics (1512 16 st, Sacramento, Ca. 96814 (916) 442-1512) and they had them in stock in 6 (!) colors, along with larger versions. (look at the battery connector on a forklift the next time you are in manufacturing and it probably will be made by Anderson).
Most of the clubs in the Sacramento area seem to be standardizing on the Andersons, probably because the ARES/RACES group and the Calif. Office of Emergency Services uses them.

Our club deceided to go with the Andersons and made a group purchase. Since most of us already had our own "standard" we just made a few adapters from our "standard" to the Andersons. They go in the bag along with the 2 prong to 3 prong adapter, BNC to So239, BNC to N,Stereo to mini stereo, stereo to RCA, ... ;-)

Face it, it's a nonstandard world out there!

If you need any Andersons, call Metro and they can send you some. If you do, say hi to Hugh Corkery (KA6CPN) for me.

Stan

This is very common among foreign amateurs. Since english is not usually
their first language, mixups are frequent. This seems to be especially
true during contests. I have received numerous cards from overseas this
way. American hams are not immune either. I also have one card from here
in the states under the same circumstances. This is more likely what has
happened in your case. Pirates who use call signs at all tend to come up
with ones that haven't been assigned yet (don't ask me how I know that :>)

Both the ARRL handbook and the antenna book have plans for a "portable
antenna" made of TV twin-lead which is just a folded dipole. I've made a
couple for 10m and they work well and match well to 50ohms. The 10m version
probably weighs less than 2lbs(1kg) - maybe less than 1(.5kg) including the
built-in twinlead feedline (mine is about 10'), part of which serves as the
matching network.

The person that originally modified my TH77AT tore the trace on the negative side of C124 completely off the board. Could someone please contact me with a description of where this trace originally ran so I can run a jumper to it? My schematic shows C132 and C133 connected closest to C124. I would like a diagram or description of where 132 and 133 are so I can reconnect the capacitor. The radio is currently working without this capacitor connected.

As I previously posted, I would also like to find out where the green jumper wire should be attached to enable 400-512 RX and TX. I believe it runs from IC10 to one side of C124 (yellow electrolytic).

Also, does anyone know if the service manual is available yet, and the cost?

Thank you,
Howard Atlas

I am a new HAM and a member of the Northeastern Radio Club. We have a repeater
we are trying to get setup on 145.31
We are using two antennas about 100ft away from each other (at the far corners
of a rooftop on campus) and we are still experiencing desense and intermodulation
interference. We are looking for anyone who might have an extra 2m Duplexer.

We are operating on negative duplex. Once we remove the interference we will be
able to run 45watts instead of 2!

Any donations or information would be greatly appreciated!

Oh i should tell you that we are using two 2m radios not a repeater box.

Thanks in advance!

Jeffrey Perry

You are right! At least this ham has been riding the "gee whiz" feeling
for the last 30 years, and still finding new things to "gee whiz" about
:-)

Don't ever let anyone talk you out of it!

Now just think how it will feel when they talk to YOU. THats the
difference a ham ticket makes.
>
>Thanks again, hope I can help others in the future.

That is what makes Ham Radio such fun. You learn more from helping
someone else than you ever would on your own too.

73 - see you on HF!

Sorry, the new technician is limited to ABOVE 30 Mhz. I suggest the high
flying OSCAR-13 and OSCAR-10 which are available at Florida and higher

latitudes for 15-20 hours a day, depending on the current solar attitude
of AO-10, and the current placement in the `19 day' period of AO-13. This
seems to me to be your only option and is a great deal more reliable than
10 meter propagationi (at least AO-13 is). At my latitude (even more so,
yours in Finland) AO-13 is available 20+ hours per day.

HI,
I am looking for a short wave receiver , that is portable.
I have looked at the Sony 2010 and the Grundig 500.
Does anyone out there have one of these they are looking to sell ?
Thanks,

HI,
I am looking for a short wave receiver , that is portable. I have
looked at the Sony 2010 and the Grundig 500. I have also heard that
the Sony 2001 is almost the same as the Sony 2010, is that the case ?
Does the 2001 have the synchronous detector, are the specs the same
overall ?
Does anyone out there have one of these they are looking to
sell ? (Now that the war is over)

Thanks,

Have for sale several Narda/Loral Phase Locked Microwave Signal Sources.
Units utilize fundamental transistor oscillator with high Q coaxial cavity,
followed by broadband stable step recovery diode multiplier. Broadband
sampling circuits are used to phase lock oscillator to a high stability

reference which may be either an internal self contained crystal oscillator, an external primary standard or VHF synthesizer.

Applications include free-running and phase-locked sources, modulatable transmitter sources for voice and video applications and manually- or automatically-tuned microwave synthesizers.

The size is approx. 3x3x4 inch. Runs at -20V. Output power on SMA-F connector typ. 10-50mW which depends on frequency and configuration.

Asking $75.- per unit. For details and available frequency ranges contact:

ZCZC AE16
QST DE W1AW
DX BULLETIN 10 ARLD010
FROM ARRL HEADQUARTERS NEWINGTON CT
MARCH 1, 1991
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

We wish Steve, W9NUF, with the Northern Illinois DX Association, a speedy recovery after returning home yesterday from a stay in the hospital. Since Steve could not write the DX bulletin this week, we want to thank Paul, KB1BE, with the Connecticut DX Association for the following DX information.

FROM THE DXCC DESK. Today, March 1, 1991 is the first day that the 7O1AA and 7O8AA QSL cards will be accepted by the DXCC desk for the new Yemen Republic. Many of the 7O8AA QSL cards were shipped in packages at bulk rate. They were not accepted by the Postal Service of France and have been returned. QSL managers in France will have to individually stamp the envelopes and ship them from France.

ETHIOPIA, ET. ET2A, Jack, is active daily on 21300 KHz around 1830 UTC operating both net and split operations. Also, check 28580 and 28600 KHz around 1900 UTC. Both Jack and second operator, Scott, are Americans working with the Red Cross in Ethiopia. QSL via Peter, WB2WOW.

BANGLADESH, S2. VK9NS, Jim Smith should be en route to Dhaka shortly. He has permission for CW, SSB and RTTY and expects to operate for two weeks after arriving late on March 10th. His call sign will be either S21U or his requested call of S21JS. QSL via VK9NS.

CAMEROON, TJ. TJ1BJ is now active on 75 meters on Saturday around 0500 UTC. Check for split operation on 3675 KHz and 3795 KHz. Also, on Saturdays and Mondays, look for him around 1230 UTC on 21303 KHz. QSL via K4UTE.

CYPRUS, BRITISH SOVERIGN BASES, ZC4. Glynn, G4MVA is now stationed here for the next two years. He will sign ZC4CZ on all bands with emphasis on CW.

ARRL INTERNATIONAL DX PHONE CONTEST. Good Luck this weekend, March 2 and 3, in the annual ARRL International DX PHONE Contest. It runs a full 48 hours from 0000 UTC Saturday, March 2 until 2400 UTC on Sunday, March 3. Remember that the 10, 18 and 24 MHz bands are excluded from the contest. Logs may be submitted on IBM compatible, MS-DOS formatted diskettes, either 3.5 or 5.25 inch, 40 or 80 track. The log information must be in an ASCII file, following the ARRL Suggested Standard File Format and containing all log exchange information.

Good Luck on DX de KB8NW/OBS

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

I'm interested in getting some info/opinions about the AEA DX Handy (10 meter HT).

If you have/had one (or have used one), I would appreciate any comments you might have about it.

If anyone knows of any magazine reviews on it, please let me know.

Thanks,

//

Problem: As have other AOR AR-1000 owners, I experienced problems with the squelch and reception of my hand scanner.

Squelch - Several frequencies, particularly those in the 453-454 MHz region, had a tendency to lock up unless the squelch setting was turned to the maximum. There was also the problem of losing a previously set squelch threshold upon turning the radio off and then turning it back on again -- requiring a readjustment each time I "fired up" the AR-1000.

Reception - From day one, reception with this radio was never something to write home about. Some received stations were below average reception-wise, while other stations could not be picked up at all. As time went on, and out of desperation, I discovered that each frequency was off by approximately 5-10 KHz. I found that by decreasing each entered frequency by 5-10 KHz, reception markedly improved! However, I found this technique to be very time consuming and not worth the money I had invested in the radio.

Solution: I placed a call to ACE Communications and told them about the "off-center" frequency problem. As my radio was under warranty, they instructed me to ship it to them for calibration.

I sent the unit via UPS on a Friday, and not expecting to see it again for at least 2 weeks, went on with life. The following Wednesday, I was shocked to get a call from the wife, who informed me that a package had just arrived from ACE Communications!

Upon arriving home, I immediately checked my radio and was again shocked. In addition to the "off-center" frequency problem having been fixed, the squelch now operated perfectly! It was now operating like a whole different radio!

Conclusion: For those that may be experiencing the same problems I had with my AR-1000 -- take advantage of your warranty and send it in for a "checkup" to the fine folks at ACE! And, in my opinion, the people at ACE were superb in both service and turnaround time.

Howdy!

I'm very new to this topic, but very very fascinated, too. Now I plan to spend some k-bucks for a good equipment. What I want is quite simple: Everything! At least, I want to receive everything, later I will focus on getting a license.
So, what do I need? I already looked around and found the ICOM R-9000 worthwhile.
What do you think? What antennas would you suggest? What do I need to decipher Morse, RTTY, Fax, AX.25, SSTV, ATV ... ? What else? How about a spectrum analyzer?
Extra scanner?

Thanks in advance.

Alex

-- MAJOR SOLAR FLARE ALERT --

MARCH 07, 1991

Flare Event Summary
Potential Impact Forecast

MAJOR ENERGETIC EVENT SUMMARY

Three major solar flares exploded from Region 6538 today. The first event was a very powerful proton-type which began at 06:13 UT on 07 March. X-rays peaked at a class X5.5 level at 07:55 UT. The event ended at 08:04 UT. This flare was exceptional in energy output. It generated moderate to strong intensity Type II and IV bursts and was associated with a 3,000 s.f.u. Tenflare which lasted 26 minutes. The flare attained a large class 3B optical rating and was also associated with a 5,400 s.f.u. burst at 245 MHz. This event almost certainly produced a coronal mass ejection with proton activity to the east of the region. No protons were observed near earth. The region is still too far east. This flare was located at S20E66.

The second major flare began at 14:03 UT, peaked at 14:05 UT and ended at 14:26 UT. The flare attained a class M5.0/SF rating, and originated from Region 6438 at a location of S22E62. This flare was not particularly powerful.

The third major energetic flare began at 23:15 UT, peaked at 23:18 UT and ended at 23:26 UT on 07 March. This major flare was rated a class X2.5/2B Tenflare with a very strong 35,000 s.f.u. burst at 245 MHz. The event was also associated with a 760 s.f.u. Tenflare which lasted 5 minutes. Although powerful, this flare was a short impulsive type which did not produce any sweep frequency events and is not suspected of producing a coronal mass ejection. However, it did produce a moderately intense Sudden Ionospheric Disturbance (SID) and Short Wave Fade (SWF) which disrupted communications on HF frequencies up to 25 MHz. Strong phase shifts followed by strong signal absorption were observed beginning at 23:17 UT over the sunlit sectors. The SWF ended at 23:34 UT on 07 March.

POTENTIAL TERRESTRIAL IMPACT FORECAST

This latest flare will not likely produce any significant terrestrial impacts. There is a slight risk it could produce active conditions after 10 March, but magnetic or auroral storming is not likely. The region was too far east at the time of the major class X5.5 flare to produce terrestrial impacts.

Solar activity will remain high for the next several days at least. Major M-class flares and isolated X-class flares are possible throughout the next 72 hours at least. Region 6538 is capable of producing some very energetic flare activity which could produce intense moderate to long-duration SID's/SWF's over the sunlit areas of the earth. Within the next 24 to 48 hours, Region 6538 will begin to enter the terrestrial impact zone. Major flares after 09 or 10 March could produce potentially moderate terrestrial impacts. Major flares after 11 March will have a high risk for producing high terrestrial impacts which could include major auroral and geomagnetic storming along with potentially strong degradation in radio signal propagation. However, that is still several days away and Region 6538 could conceivably calm down by then. On the other hand, it could also become more energetic. It currently possesses a Beta-Gamma magnetic configuration with significant amounts of shear and high magnetic gradients.

The Calcium XV emission from Region 6538 increased to very bright levels during the day today. It appears as though Region 6538 will remain a significant threat throughout the coming week. The position of Region 6538, corrected to 24:00 UT on 08 March is S25E48. It will reside very near the central meridian on 12 March and will cross into the western hemisphere on 13 March.

As a side-note, geomagnetic activity will remain at unsettled to active levels throughout most of the coming week. Storm conditions could occur if major flaring continues.

Additional alerts and/or updates will continue to be posted daily for as long as necessary.

** End of Alert **

<Total Score: 11.8M, beating our record from last year.

Great score John!

```
<80     235      80    W3LPL
<40     430      90    N3GB, KC3EK
```

I am just getting back on the air after about 5 years of inactivity. In the past I did several single 40s or operated 40 from K0RF in multi-multi. It seems to me that the 40 and 80 SSB QSO total for the east coast multi has gone way up (in contests were you can't work VEs). Is there more Europe to run now, working more JAs, or are you passing lots of non-mult QSOs down to the low bands?

Hope I can get some kind of station together before all the spots go away!

73,

Jay K0GU

Try the "Fish" disks of Public Domain software. Somewhere around #200

or 300 there is one which reads a text file and generates Morse code at
a specified speed. Of course, you need some text files...

That beep I do hear on CNN-International on Intelsat 27.5 degrees
west as well, but it definately is not the E morse code, it comes
from their computer.
I visited CNN some time ago on professional reasons and heard that
same beep from all their terminals when a message arrived (they got
a one line display for individual or broadcast messages on each of
their computer displays).
On satellite there is a datga channel from Atlanta though,
which gives a preview of their programming for the next few hours.
This certainly is not in morse code.
Wolfgang

Hi,
I am looking for pointers to companies selling magnetic antennas for
HF (loop or loop-stick.) Automatic tuning would be preferable but is
not necessary. The only place I could think of was Palamar Engineering,
and they are closed for a vacation. Any guidance would be appreciated.

Thanks,

Alan (:^|

My old stand by scanner (Bearcat 250) has developed a problem. It works normal in search mode (enter high & low freq - scan between them). Also the bank buttons, speed, priority, manual, scan, etc all work normal. The problem is that all 50 channels have the same freq (9xx.xxx) with delay any lockout set. When I try to reprogram a channel it goes right back to the (bogus) 900 frequency.

Does anyone have any ideas whats wrong? How about any place that repairs these old babies for a fair price (perhaps flat fee swap out)?

Dan

Subject: Stolen Radio gear
Message-ID: <tim.698214806@irie.ais.org>
From: tim@irie.ais.org (Tim Tyler)
Date: Sat, 15 Feb 92 23:33:26 EST
Distribution: usa
Organization: UMCC - Ann Arbor, MI USA
Keywords: Icom 900 system, CMT, handheld scanner...
Summary: All taken in a Michigan car theft, 14 FEB 92
Lines: 49

The following items were STOLEN during a vehicle theft occuring in Madison Heights, Michigan on 14 FEB 92:

Icom IC-900 transceiver control head, sub units A & B, each with serial # 01205. UT-29 CTCSS board installed.

Icom UX-39A 220MHz module for IC-900, serial # 01222.

Icom UX-29H 2 meter module for IC-900, serial # 01289.

Icom UX-49A 440MHz module for IC-900, serial # 01734.

Icom CF-11 Cooling fan unit for IC-900, serial # 01328.

Uniden HR-2510 10-meter radio, serial # 83006772.

Fair Mate HP-2000 handheld scanner, serial # 19169.

Panasonic EB-362 transportable cellular telephone, in black carrying bag, serial # 157980.

BEL 'Vector 3 Remote' tri-band remote radar detector, serial # 267723.

Chances are that the above items will eventually turn up at hamfests and/or pawn shops in the Detroit, Michigan area.

If you come into contact with any of the above items, please contact the local police immediately, and/or contact the Madison Heights (Michigan) Police Department at 313/585-2100, citing case # 92-3167.

Also, I hope that EVERYONE with radio equipment in their vehicle(s) will verify that your insurance policy will cover such items, before you learn the hard way that it doesn't! It is also important to keep a listing of the serial #s of the items.

Thank you,

Tim

This is a call for discussion on the creation of a new Usenet newsgroup, tentitively entitled rec.radio.broadcasting. I am proposing that this newsgroup be moderated, and barring any serious objection, I am offering my time and energy to BE that moderator.

As the 'statement of charter' indicates, I believe that a group of this type is needed on Usenet because there is no current newsgroup dealing with the general subject of radio broadcasting. Yet radio is, arguably, the most consumed of all mass media, in terms of actual person/hours of exposure. People listen to radio in their cars, in their offices, while jogging, dining, reading, getting ready for work, commuting, and just about any other conceivable activity. Radio shapes our opinions, perceptions, musical tastes, and (hopefully) stimulates our imagination.

For these reasons, and others, I propose the creation of this newsgroup.

I suggest a 'moderated' format, for these reasons.

1) A properly moderated group generally produces a more concise and cohesive product w/less "net-clutter" and a higher signal/noise ratio.

2) If the moderator is knowledgable in the subject matter covered in the newsgroup, s/he can be of assistance in responding to questions posed to the group which might, otherwise, go un-answered.

3) Moderation of a newsgroup means different things to differnet people. My concept of moderation is simply to act as a buffer, weeding out test messages, repetitive, abusive or 'grossly off topic' messages, and to re-direct, misplaced articles to appropriate newsgroups.

I am an experienced broadcaster, and have had an avid interest in the medium since early childhood. I would consider moderating this group an honor and a pleasure, because of my respect for the medium, and the people in it. Plus, I have time and willingness to dedicate to such a project.

The tentitive name of 'rec.radio.broadcasting' (r.r.b) is, of course, open to change if a better title can be created. While the charter of the group suggests potential topics which are not specifically recreational, I tend to feel that 'rec' might be the be the most appropriate heading since the only other Usenet group dealing with domestic broadcast radio (rec.radio.noncomm) uses this heading and therefore r.r.b would be a good companion group.

I considered the name 'talk.radio.broadcasting', but felt there might be a misunderstanding that the group was centered around the 'talk radio' format. Perhaps something like 'talk.broadcasting.radio' might be a good alternative, but that will be determined by you folks "out there in Usenet-land" :), assuming that the process gets that far.

I do not envision r.r.b to be a replacement for any other newsgroup, including rec.radio.noncomm. The latter group's focus is on a specific genre of radio and therfore I feel the two groups would compliment, rather than compete with, one another.

****** Statement of charter; rec.radio.broadcasting. *********

Rec.radio.broadcasting (r.r.b) will be for discussion of a wide variety of subjects pertaining to the general arena of entertainment/information radio. While not specifically limited to North American broadcasting, r.r.b will avoid dealing with international (shortwave) broadcasts because this topic is already being handled in rec.radio.shortwave.

Valid subjects for discussion might include (but not be limited to);

1) Programming and formats
2) Technical and engineering matters
3) Concerns of smaller market stations
4) Innovations and legislation affecting the medium
   (and those attempting to enter it)
5) Radio's historical & cultural significance
6) Radio news coverage and it's impact on our nation and our world.
7) Audience input and ideas for improving the state of radio broadcasting.

Since rec.radio.noncommercial is the only Usenet group pertaining to domestic broadcast radio, r.r.b would provide a forum for those individuals who's interest in the medium is not limited to the non-commercial arena. I believe this group would be of great interest to Usenet participants because ...

1) Everybody listens to, and is affected by, radio broadcasting. It is the only mass media in which one can fully participate, while engaged in another activity.

2) Colleges and universities currently train, and graduate, thousands of potential radio professionals every year. These individuals would be very likely to participate in such a forum to discuss and compare notes on their chosen field of endeavor.

3) The face of radio is always changing. Satellite feeds, automation, and other influences are molding the future of the medium. This newsgroup would be a link between interested parties from all corners of the industry, keeping one-another up to date on the latest trends impacting radio broadcasting in America an beyond.

********************** End Of Statement Of Charter *********************

I welcome your comments and suggestions. If all goes reasonably well I will be putting out a 'Call For Votes' in about a month and hopefully the Usenet community will agree that such a group would be a valuable addition to it's heirarchy. Since this is not a proposal for 'splitting' an existing newsgroup, but rather for the creation of a group to fill a 'vacancy', I hope you will seriously consider a positive response to this proposal even if you, yourself, are not particularily involved or interested in broadcasting. Such a group could only augment the already diverse spectrum of Usenet newsgroups.

Feel encouraged to post responses to news.groups, and/or to e-mail me directly at the following address.

At the low end we have Atlas Circuits (P.O. Box 892, Lincolnton, N.C 28092), who will do a board for only $0.78 a square inch plus $0.01 per hole plus $7.50 to make film from 2x art. No plated-through holes, no silkscreen, no solder mask, no inspection, 15-mil design rules. $10 minimum.

At the high end we have places like Hunter Technologies in Silicon Valley; plated-through holes, silkscreen, solder mask, accepts data files via modem, 100% inspection, fine-line design rules, multilayer available, MIL-spec qualified, various board materials available, minimum prototype order 10 boards at $400 to $600.

Who's in the middle? I'd like to find someone who charges $100 or so and can do plated-through holes. Solder mask and silkscreen optional. Suggestions?

John Nagle

Any "real ham" who expects to see the word "propaganda" on his FCC theory
test is in for a rude shock.  I suppose that some hams might use it as a joke,
and others might use it because they no longer know any better (the same ones
who use "omen meters"), but you won't find anyone knowledgable doing so with
a straight face.

John, WB7EEL

(By the way, "rec.ham-radio" is moribund, "rec.radio.amateur.misc" is the
sleek, high-tech replacement.  Bug your local news administrator if you
don't have it.)

No.  The ham magazines and manuals are full of propaGATION (correctly spelled)
and I've never heard it called "propaganda."

I'm not only a ham, I'm a linguist, and I'd say offhand that either he was
genuinely mistaken and tried to cover it up, or else he is very insecure and
is eager to find some kind of obscure jargon to use in order to get the
feeling of being part of an "in crowd" (rather the way CBers used jargon
in the 1970s).

Hello,

I have two RCA CR-91A receivers. These are old tube-type general
coverage receivers built sometime in the late 40's, early 50's (I think).
Both are in very good shape and weigh something nasty! Anyone who is
interested in these please contact me via e-mail. I would prefer if
only those familiar with these receivers purchase them. If you don't
know what it is, you probably don't want it :-)

73's
       Rich, VE4AIV

P.S. I am still looking for a Hallicrafters HA-20 VFO...

As a ham and SWL (shortwave listner), I thought your friend was
referring to the propaganda that one hears below 30 MHz in the AM
mode.

One need only listen to Radio Habanna (Cuba) or other such "official
government news stations" to see what I mean.

73,
-Joe

Apartment available May 1 on Oakland, near the University of Pittsburgh.
It has a multiband vertical R5 on top of the building which is 7 stories
high, with no obstacles around. This antenna is high and on the clear.
 Work plenty of DX as my logbook shows!. If interested respond by
e-mail or call 412-6835178.
Ah! The apartment has two bedrooms, two bathrooms and is on the sixth
floor. It has microwave, diswhasher,.. you name.. and it has
ANTENNAS!!. Be prepared for a >$700 a month rent.

Juan , NA0B.

Subject: CFV rec.radio.broadcasting
Message-ID: <1992Mar28.081827.10084@chinet.chi.il.us>
Date: Sat, 28 Mar 1992 08:18:27 GMT
Organization: Chinet - Public Access UNIX

This is a Call For Votes on the creation of a new Usenet newsgroup entitled 'rec.radio.broadcasting.

STATUS: Moderated.

PURPOSE: This group will be for the discussion of a wide variety of subjects pertaining to the general arena of domestic radio broadcasting. Topics of discussion might include (but not be limited to): Programming, Engineering/Technical, Radio news and political coverage, Challenges of secondary market stations, Innovations and legislation affecting the media, Historical and cultural significance, Network radio, Domestic pirate broadcasting, Differences and similarities in 'domestic' radio of various nations, General items of interest to broadcast professionals, hopefulls, affectionados, and casual listeners, Assistance to those desiring to enter the industry by providing a 'networking' infrastructure.

REASONS: Everybody listens to the radio. It influences our lives, our political beliefs, musical tastes, purchasing habits, and (hopefully) stimulates our imagination. Radio, in it's many forms, is pervasive. It is the only mass media in which one can fully participate while engaged in another activity. Amazingly, there is no Usenet newsgroup dedicated to the overall topic of radio broadcasting.

Limits: I do not envision rec.radio.broadcasting to be a replacement for such groups as rec.radio.noncomm or rec.radio.shortwave. Rec.radio broadcasting (r.r.b) would try to avoid dealing with subjects which are directly and _specifically_ related to the charter(s) of these groups, but will gladly cover _any_ subject which has significance to radio broadcasting in general, even if it involves noncommercial or shortwave stations. R.r.b would be likely to shy away from discussions (flame wars) about specific performers & bands, except as it pertains to radio programming and formats (there are many .music groups on the net for such discussions).

MODERATION: I have proposed this as a moderated group. I have also volunteered to serve as that moderator. I believe in a very 'light-handed' approach to moderation. Basically no more than a buffer, re-directing misplaced articles, attempting to quell excessive 'free-for-all-flame-fests' :-), and trying to keep the signal/noise ratio on the 'signal' side :-). *** I AM NOT A CENSOR ***. I will NEVER kill an article because it clashes with my beliefs or opinions! In addition, I have my own dedicated Unix system with it's own direct Internet e-mail feed, I have time and energy to dedicate to the project, I have had a life-long involvement with radio and communication, plus the wise counsel and support of many in the industry, and on the net.

TO VOTE YES, SEND E-MAIL TO 'yes-rrb@gagme.chi.il.us' (OMIT THE QUOTES)
TO VOTE NO, SEND E-MAIL TO 'no-rrb@gagme.chi.il.us'

Only votes sent by e-mail, to the above address will be counted! Do not respond directly to this post. Voting will end on 4/30/92. No conditional votes will be accepted. Votes should have a line in the subject or body of the letter stating clear intent, such as..
"I vote yes on rec.radio.broadcasting as proposed" or
"I vote no on rec.radio.broadcasting as proposed", or some similar non-ambiguous statement. Mass acknowledgements, and possible re-posts of this CFV will appear from time to time in news.announce.newgroups and news.groups as well as other related newsgroups. Vote counts will be verified (if needed) by the sysadmin at the 'gagme' site.

If anyone desires direct corespondence with me on this subject, please write to me at my personal e-mail address 'wdp@airwaves.chi.il.us'. However, I will not enter into any discussion of vote totals or projections while the vote is underway.

** VOTES WILL NOT BE ACCEPTED AT THE 'AIRWAVES' ADDRESS! ***

(Exception to above rule: If your vote bounces, send it, and the entire bounced header, to me at airwaves, and it will be included).

Thanks to those who expressed support.

Respectfully

William Pfeiffer

This Spring, an Amateur Radio interest group will be forming, serving PSU and Reed College. License classes will be taught, license examinations will be given, and several ham radio stations will be installed and made available to licensed operators.

Amateur Radio has a wide variety of areas and things you can get into - from television to radio/computer networking and packet transmission - Ham radio has it all. If you'd like more information, or if you're interested in getting involved, send email to glen@janus.cs.pdx.edu and we'll notify you when an organizational meeting is planned.

Greetings Netlanders:
Forgive this if it seems to be posted to the wrong group, but there doesn't appear to be a group for embedded controllers.

I have read that there is a BBS which Motorola uses to support their embedded controller products. Would somebody please email me their telephone number?

Additionally, is anybody aware of a inexpensive C development environment for the 68XX processors? I was able to FTP an assembler from plains.ndsu.nodak.edu, but I am hoping someone has a compiler or cross compiler for this family.

Thanks in advance for any pointers!

Guy (KQ6J)

Well, it uses and LCD display, so regardless of sampling speed it doesn't look like a crt scope. Fluke had a display here at Intel and the 97 looked pretty good to me.

>picture)? What limitations have you run into? What doesn't it do that
>you think it should do?

I can think of one possible draw-back to the 97: I'd be pretty cautious about using the DMM portion of a near-$2000 DMM/scope combo like this in any high-voltage/high-current aplication. I suspect the DMM and scope share some or all of the same processor, so any fatal over-voltage to the DMM could take out the scope too. I've learned the hard way that fuses don't always save you from your own negligence. Thus, I'd likely use the 97 primarily for the scope, and in that case I'd be better off with a separate scope and DMM. It may be that the 97 is rugged enough to handle massive over-voltage, but I'd hate to find out differently.
David Covell (who destroyed a $200 Phillips with 1400 VDC and learned the hard way that some meter manufacturers won't sell you replacement processors).

I have a 97 and love it. First off, forget any of the scopes except the 97. The others are unconciously gymped.

here's the good stuff.

It really does have a 50 mhz bandwidth on one channel. Less when running dual trace.

The screen is adequately fast, though the display update does sometimes lag the input by a fraction of a second. Think of it as a delay line. For signals that vary rapidly, there is an envelope mode that turns on all dots the signal crossed during the sample.

Fully isolated case qualified to attach to power lines of up to 600 volts.

A,B,A-B mode allows one to view all three phases of a three phase circuit, say of an inverter.

Several setup and waveform storage memories. Waveforms can be recalled to the display in any combinations.

Auto-setup. On repetitive signals, pushing this button picks the proper sweep and vertical scale to display a reasonable waveform.

Digital zoom. works by changing the sweep and trigger delay to keep the center of the screen centered.

Trigger works very well and is displayed on the screen.

Several transforms available including smoothing, averaging and pass filters.

Delay can be samples, events or sweeps.

Scope can accumulate twice the screen display's worth of samples which makes the pretrigger queue fairly deep.

Optically isolated data output can dump data, memories, the screen in either epson or HP format and accept remote control commands.

Voltmeter mode works very good, is fast and can display a mini-scope trace even on ohms. Min/Max mode displays min, max, average all in one display. AC is true RMS.

Is small enough to be carried almost everywhere. I hauled mine to the dragstrip this weekend to use to observe a radar gun output.

If the ni-cad pack goes dead, you can remove it and install dry cells. Nice touch.

Battery life is good. Days with the backlite off, spec'd 4 hours with it on. I've gotten more.

Here's the bad stuff.

You gotta kiss Fluke's ass to get 'em to sell you one. They began advertising the scope months before production started. I started trying to get mine back in November. Raising hell, including calling Fluke's president, did no good. I got mine about a month ago.

Fluke has honed the art of unbundling to a fine edge. The scope is reasonable but by the time you get through equipping it, you've got real money involved. Examples: Serial interface - $150, PC interface software - >$500, Amp clamp $100-$150 (ac or dc), Carrying case - $70 to $150, Service manual - $50 and so on.

Scope probes are fragile - I broke one the first day - and not anywhere near the quality of Tek probes.

HP printer output is not really PCL. It drives my clone laser printer fairly well (actual screen sized dump, rotated to landscape) but I've had a hell of a time trying to inport it into publishing software - one reason I bought the scope.

Screen dump is very coarse.

Backlite is inadequate.   Needs to be much brighter.

Keys are heavily overloaded. Too many softkeys. Even trigger level is on a soft key.

Voltage readings must be taken through the the A channel probe. It cannot be routed to the bannana jacks where ohms and such are done.

When the mini-scope display is up on the ohms screen, the sweep is fixed.

It has a dumb software limitation that one trace must always be on. That means you can't just turn off both channels in preparation of recalling stored traces. You have to turn your traces on and then go back and kill the real time traces.

The A/D is noisy, displaying a couple of pixels off of baseline even with the input shorted, either with a shorting plug or by selecting "gnd" on the input selector. It appears to be independent of range.

Input channels share a common ground. While this is typical of analog scopes and at first blush would not seem to be a problem, you find yourself using the scope in situations where separate grounds would be nice. Fluke will sell you a ground isolator - for a price.

The front of the display is extremely glossy which means reflections of overhead lights kills the display. I usually turn the lights off and use bench lights when using the scope. This is really dumb and unnecessary.

The highly touted signal/function generator is useless. Only a couple of fixed, oddball frequencies. This is obviously a case where a few bytes were available in ROM so the developers gave marketing something else to crow about. Forget it exists when evaluating the scope. The manual kinda indicates arbitrary waveform might be available using the PC software but I don't know since I refuse to pay the extortive price.

The fluke reps were very unresponsive. I got more info from distributor salesmen. I originally contacted Fluke to obtain a unit to do a magazine review on. Even this didn't faze 'em. They're not gonna like my review.

The scope is actually a Philips. I HATE philips scopes. That was a major reservation against my buying the unit. I know Fluke could have done a better front panel.

If you get one, save your money on the serial interface. Just to to radio shack and get that IR LED/photodetector they package together and wire them through level shifters to an RS-232 connector. I think they'll probably insert into the holes in the scope body. The factory cable powers the level shifters from the RS-232 handshake pins. This is a real f*ckup which precludes using a serial to parallel converter on parallel printers. First time the converter handshakes (typically between each byte for the cheap portable ones), the interfaces loses power and the dump is gone.

I'd make the same purchase again mainly because there is nothing else out
there. The Leader is a joke. So are the new Tek handhelds. For a
third more money ($2400 list), you don't even get trace annotations
or on-screen data. I had one in for a couple of days to evaluate
while waiting for the Fluke. Tek apparently thinks their isolated
input channels and CRT are going to sell the unit. NOT!

I like the scope and use it about 85% of the time but I do still the
465B sitting on the bench.

```

Subject: Internet news/mail/etc. now affordable via Satellite & dialup
Message-ID: <BnFK8y.ItD@world.std.com>
Summary: Announcement of new Internet access service
Keywords: internet new email dialup satellite news
Organization: The World @ Software Tool & Die
Date: Tue, 28 Apr 1992 18:19:45 GMT
Lines: 163
```

Please read and return the following form and give copies to anyone interested or that should be interested in Internet access, especially NetNews and Email.

Internet News and Email Now Affordable via Satellite!

Available by June of 1992 for as little as $10-$20 per month in the Dayton area. Other cities will be added as demand warrants.

A new service is now being created that will provide a full feed of the world renown Internet NetNews (aka Usenet) and other services, including professional quality Electronic Mail (Email). This is a commercial service and is based on the Commercial Internet Exchange (CIX) services and guidelines. This allows this service to be used for very inexpensive commercial data traffic for EDI, email, data transfer, etc.

Long distance phone charges have finally been overcome for bulk data transfers. This is a new service making available for the first time: hardware, software, and satellite bandwidth for transfer of public access network information. With just a 386 or any other Unix capable system, we can provide software and satellite download hardware for a continuous 9600baud asynchronous connection. A low cost turnkey system is being developed now.

Some facts about Internet and its services:

Email:
Connection for email to nearly 10 Million people world-wide in all technologically advanced countries. A few notable examples: All of North America including nearly all Universities and businesses, most commercial and public email services (Compuserve, Fido, Genie, MCI Mail, ATT Mail), all of Europe, Russia, India, Israel, Japan, parts of South America and Africa, Australia, and New Zealand. Email is fairly secure and encryption is available.

News service:
Over 1200-1800 newsgroups on many subjects, hierarchically organized. This is not a traditional news service, but like a world-wide bulletin board system. Anyone can post to any group (although some are moderated) and their message is seen by up to a million news readers. Traffic averages over 30 Megabytes and 5000 NEW messages per day. Example newsgroups:

comp.graphics
comp.sources (with subdivisions)
comp.binaries.ibm.pc
misc.jobs.offered
misc.jobs.resumes
comp.std.c
rec.humor
misc.consumer
alt.bbs.allsysop
alt.bbs.ads
rec.radio.amateur (with further subdivisions)
soc.culture.australian
soc.singles
etc.

Archives of source code, binary (executables), data:
Access is possible to thousands of sites where archives of public domain or shareware source code and executables for every major computer, including: All Unix, MS-DOS, Mac, Amiga, etc. Each of these sites is larger than most bbses, often with Gigabytes of storage.
Also available are:
   standards documents
   archives of certain
   newsgroups
   public documents like the US constitution

public data like CIA World facts and maps, NASA pictures and archives, National Institutes of Health information, National Institute of Standards, various Security organizations.

People:
The leaders in technical fields often are available via email and sometimes personally communicate on and monitor Internet. Notable examples: Kernigan & Ritchie Bell Labs, Mitch Kapor EFF, Richard Stallman GNU.

Misc:
Time service, weather service, access to many commercial software or hardware companies for support.

There are several possible ways this service could be obtained:

Individual or small company Consumer:
Would make a local high speed serial call to a "Local Internet Gateway". This would allow reading or transferring email and news articles and posting or mailing new messages. Typical costs:
$5/mo and $2/hr or $20/20hrs. with discounts for higher volume.

Larger company or "Local Internet Gateway" provider:
Purchase software, satellite download equipment (18" dish, v.29 external modem, receiver, cable), and optionally a computer system with multiple serial ports and high speed modems.
The satellite download equipment would cost $1500 and software would be approximately $500-900 with a small yearly maintenance fee.
A commercial dial-up service would also be established with dial-up or high-speed leased line. This can run from $4/hr to $1000-2000 for T1 speeds (1.54 Megabits/sec). This connection is used for outgoing email and netnews traffic, error recovery for the satellite link, and telnet/ftp/irc(Internet Relay Chat, like CIS CB simulator)/X-windows traffic to be multiplexed. Multiple users can share the bandwidth.

Large regional network provider:
Provides the previous with high bandwidth access to CIX and provides local companies with low cost direct network access to Internet through a "firewall" system.

Internet News and Email Now Affordable via Satellite!

New customers are needed to help plan for capacity. Dayton will be the first city setup, with several others following immediately.

Customers in any area or those interested installing a private company connection or a "Local Internet Gateway" should contact us so that we may coordinate.

This is especially valuable in smaller towns where there is no local computer service access.

Please fill out the following for interest registration and any requests for more information to:

well, I had the Fluke rep. come down to my office & give a demo. I'd been screwing around with this piece of crap Beckman Industrial calls a scope for the last 2 hours trying to get a decent reading on a nonlinear capacitive discharge. Fluke guy walks in & tries to show me his "look at the nice sine wave demo". Boring. Stop says I, plug it into this. Okay says he. I press the AutoSetup button and bingo: one perfect reading to go. I started to jot down the readings in my notebook when he just plugged the 97 into my the HP on my desk. Initial connect to hardcopy: less than 5 minutes. I ordered one on the spot.

That was back in December: still haven't got it. Fluke is backordered up the wazoo. They say May 15th. According to the Fluke rep, software bugs aren't the major concern for the 97 that they usually are for most embedded systems: he says that the entire firmware (about a megabyte) resides in nonvolatile ram. Bug fixes can be downloaded to the client through the serial port. Excellent move. Made me feel comfortable ordering a revision 1.00 unit.

>telephone number?
>    Additionally, is anybody aware of a inexpensive C development
>environment for the 68XX processors?

The BBS you mentioned is the one Motorola maintains, it contains lots of
goodies, like cross-assemblers, HC11 (small)-C compiler, etc.
Some with sources but not all :-(

Now about the BBS:
Its is called: Motorola, Freeware, Electronic Bulletin Board
Access instructions:
        1) Set system character format to 8-bit, no parity, 1 stop bit.
        2) Dial freeware number (512) 891-FREE (891-3733)
        3) Enter the requested information to log on.
           You are now a registered user.
        4) Follow the menus for the desired functions.
           (E.g. download, upload, mail etc.) Online help is available.

P.S.
If you make contact, please leave a message to the sysop, that we here in
Europe would like to receive a new copy of the BBS, the last update
we received is now about 3 years old.

I just picked up a J-Antenna to do my 2m packet, but I don't see by its design how it works: it would seem the _metal_ bar across the base short circuits the input. Except for the short ckt, the antenna reminds me of a tuning fork...is this a close analogy?

On Mounting: Given the design of the J-Antenna and its metal base, does it need to be isolated from the mast (which goes deep into the ground)... Or can it be grounded without affecting the performance of the antenna?

Thanks in Advance,
Jason Cathcart

Hi,

I am not really an amateur radio enthusiast, but I thought that this might be a good place to ask this question. I was wondering if there was anything that I could do to improve the reception of a standard AM radio. Since these radios typically do not have any connections for an external antenna, I am sort of at a loss regarding how to apporach this. I seem to remember seeing something a long time ago about being able to build an antenna that can somehow can be inductively coupled to the radio rather than directly connected, but

this could be a figment of my imagination :-) Any help that you could
give me would be greatly appreciated.

Thanks

I have various hardware items for amateur satellite radio for
sale/trade/etc. I am basically trying to get rid of them, but still would
like to see a fair price.

For sale:
10' steel tripod and mast
Alliance AZ rotator and controller
Kenpro EL rotator and controller (also fiberglass boom)
18 element 435 MHz CP beam (RH and/or LH sense, 12V remote)
50+' 9915 coax
50+' coax -- semi-hardline...but not sure of type off hand

I will deliver them anywhere (in general PNW area). Make offer...(yes, I
usually like to see the prices posted as well).

I'm really seriously underwhelmed by certain individuals on the Cornell payroll, such as those in Student Government and/or Campus Activities who can't even determine the whereabouts of a student organization. Reminds me of tenured EE professors who were "surprised" that the University of Maryland had a ham club (we've had one for damn near 60 years).

But anyway, your post deserves constructive suggestions and not soapboxing (enjoyable as that may be :-). I've sent along information about the Ham-Univ mailing list for college clubs, which may have some subscribers from Cornell. (Other interested individuals can E-mail me for subscription information).

If that fails, you might try Luck Hurder, KY1T, with Club Services at the ARRL. His E-mail address is lhurder@arrl.org and he might be able to provide contact information for the Cornell club.

Good luck with your quest.

I want to build a cross-polarized (circular polarized) antenna for relatively short range operation. It is to receive a signal from a small transmitter that might be in almost any position.

The simplest approach is to make two dipoles at right angles to each other. I am working at about 86 MHz. I don't want to space the dipoles 1/4 wavelength apart, because I don't have the space. Can I arrange two dipoles almost touching each other? How do I feed them to keep a 50 ohm match? Do I have to worry about the phasing between them? Do I care if the circular polarization is right handed or left handed?

Please send a copy of your suggestion to my Mail address so I won't run the risk of missing your posting. Thanks.

The last I knew, Cornell had an active club, located in Barton Hall. I am sure I chatted with someone from the club on their two meter station when I was visiting there within the last year. In addition, a few months ago I talked with a recent president of their club who had relocated to MD. So I am sure they are still around. Tell your friend to try snooping around Barton Hall or to consult the student directory.

Two other possibilities. The people at the front desk of the Straight (any Cornellian knows what that means) usually know all their is to know about student life at Cornell. Alternatively, you could consider asking at the library (radical thought in these days when all information has to be online, or it doesn't count). Uris library, in particular, has a wealth of information about the campus and the various activities.

OH6DD, OH2BC, OH1ZAA, UW1AE and UW3AX will activate Vyborg UA1 on July 5-10.
Operation is postponed by two days from the original plan. Operation will
take place from a hotel which is one of the highest buildings in Vyborg.
Operation frequencies are 50.135, 50.105, 50.120, 50.155. Callsign is UX1A,
grid KP40. Set-up consists of FT-650 + 5 el yagi. QSL via OH2BC.

Heading for UA1 in about 30 hours from now. CU in the pile-ups.

Same equipment that will be used at UX1A will be lend to YL/ES9C dxpedition.
The date has not been decided yet. Enn ES1AR has licence that allows
operation on 50.100- 50.200 MHz on June 25 - August 25 1992. Arvo ES1CW
and possibly some OH ops will join (number of trips to YL is not limited).

Email to this address bounced. Anyway, here's the info. The Cornell ARC is located in Barton Hall at the top of the tower on the left side (as you look at the front of the building). You can see the antennas from anywhere on campus where you can see Barton.

Also, you might try contacting Steve Powell, N2BU who has an office in the Theory Center and is active with the club.

Hi Friends

I am looking for a cheap source of power carbon or
non inductive resistors for R.F. applications. The
value I require is 800Ohm 50W. Any parallel or series
combination will do; 50 1W resistors are not cheap!

Thanks

John Peirce

Three summers ago I was at Cornell for a two week seminar. I saw the antennas
and inquired at the student union or some such information center and they
promptly directed me to the president of the club.

For $5 I got a key and the use of the station for two weeks. Except for the
long climb to the station, it was a wonderful experience at Cornell.

I suggest that the student be more resourceful!

Try the Carborundum Company in Niagra Falls, NY. They make a good line of high-power non-inductive resistors. Caddock Electronics (Riverside, CA) and Bird Electronic Corp. (Cleveland, OH) also come to mind.

You will probably find 50 1-watt resistors are far cheaper if you really want low inductance.

John,
Several years ago I needed a 100W 70 Ohm non inductive power
load. Rather than purchase 50 2W carbon resistors I took ten
2W resistors (DETERMINE VALUE NEEDED BY FORMULA FOR RESISTORS IN
PARALLEL), made a sandwich with all of them in parallel on
copper plate, attached an RF connector to a gallon metal paint
can lid, filled the can with mineral oil and dropped the whole
mess inside. There was some minor loss of total resistance
from the oil, but overall it worked great! You will need a
small vent hole in the lid. If you really want to be safe,
keep the thing in the refrigerator until you need it. Should
handle your power for up to 10 continous minutes without damage
to the resistors.

Subject: MTS, NICAM, and SLC
Lines: 20

Here in Madrid several TV stations have started broadcasting in two languages-- original version (usually English) and dubbed (Spanish). According to an article in the newspaper, you need a "special" TV to tune the alternate language soundtrack. I'd like to believe there is a cheaper way.

Can anyone explain how this works?

I've heard that in the States there is something called SLC ("second language channel") or MTS (stereo tv), and that one can buy an MTS decoder pretty cheaply. The short newspaper article called the alternate soundtrack scheme "NICAM". Is MTS/SLC the same thing as NICAM?

Thanks!

Japan Radio NRD-525 shortwave receiver still for sale, now for $650....

0.09-34 MHz continuous tuning, RTTY, CW, USB, LSB, AM, FM, FAX. 200
memory channels, two internal clocks, both flywheel and direct access
tuning, and probably one of the best Passband filter systems on the
market. Includes optional computer interface and cabling
(retail $1,000).

A really good price on a damn good radio, I might add.

I own an NRD525 and a 535D. THey are really fine radios....

The title basically says it all, I need some K-Band transmitters which normally take the form of Gunn Diodes, however I am open to other suggestions. I believe that M/A-Comm is a manufactuer but I am not certain. If you have any suggestions on where to find these new, or used (like from radar guns) I would really appreciate hearing from you.

Thanks,

Lance Ware

Subject: SONY Watchman channel selection problem
Message-ID: <1992Sep23.072748.14112@eng.ufl.edu>
Followup-To: sci.electronics
Originator: george@delta.ee.ufl.edu
Keywords: SONY, Watchman, TV, ATV, tuner, IC
Sender: news@eng.ufl.edu (Usenet Diskhog System)

Lines: 25

Does anyone have any information on controlling the automatic station scan function in a SONY Watchman? I like to DX and the scan will only stop on a station with a strong signal.

There are only three external buttons on the unit which deal with channel selection. 1) Channel +, 2) Channel -, and 3) Ch Call (which just puts a marker on the screen to show you what channel you are on when you aren't scanning). I've tried pushing every combination.

I imagine this is something that the designers didn't expect the average viewer to want, but it would be simple enough to have the Ch Call button interrupt the scan. Or allow a fine-tuning mode with the + and - buttons while Ch Call button is depressed.

It would also allow me to lock on to stations in the ATV band, as the unit scans across them during power up on the UHF band. The ATV stations come in clearly, but apparently the unit is not allowed to lock on 'out-of band' signals.

So how about it? Any SONY engineers out there?

Please reply via direct email to george@alpha.ee.ufl.edu as our newsfeed is programmed to drop anything of importance.

Thank you

I'm looking for someone to make a small quantity of
printed circuit boards of professional quality.( < 10 )

Size is 7.5 x 13 cm G10 1.5 mm thick, double sided.

Any leads would be welcomed.

Thanks,

     Sean.

PC boards and kits for many QST projects

Atlas Circuits Company
P.O. Box 892
Lincolnton, N.C 28092
704-735-3943

Last known prices: $0.78 per square inch, $0.01 per hole, $7.50 to make film from 1X or 2X artwork. No plated thru holes, no silkscreen, no solder mask, no inspection, 15-mil spacing design rules. $10.00 minimum.

I have had them do up to small production runs, and the delivery is excellent. They take 2X or 4X (1X with no guarantees) camera-ready artwork (plotter, laser printer with GOOD toner, etc.).

The boards come back sheared and tin-plated. 10 mil traces appear to survive their process, although only 15 mil is guaranteed. Ask for their order sheet, which has instructions on it.

Express Circuits
314 Cothren St
POB 58
Wilkesboro NC 28697
800 426-5396

The can take output from Tango, Protel, SMartwork, HIwire, EE Designer and Gerber.

Far Circuits
18N640 Field Ct
Dundee IL 60118
no telephone

They will make printed-circuit boards for any League publication project artwork.

---------------------------------------------------------------------------
PCB Kits
750 Mariday
Lake Orion, MI 48362
313-693-0328

PC-board supplies. Some of their prices, from a recent sheet:

Complete kit--everything, $29.95.
6 X 6 X 1/32 single-sided pre-sensitized, $3.48
...double-sided, $5.16

A great advantage of these guys is their boards use a
_positive_ photoresist, meaning you can just Xerox a
pattern onto a transparency and go!

In Ottawa, we get ours done at:

Brock Circuits Inc.
101 Schneider Rd,
Kanata ON,
K2K 1Y3 (613) 591-7321

We supply them with the masks (printouts) from an epson printer, as produced
by some PCB layout software, and they make the double sided board.  Pretty
cheap too, about 30$/board in quantities of one (15x30cm).

* ANNOUNCEMENT *
****

This message is to announce the resurrection of North America's oldest university amateur radio club, namely

ARCMU   Amateur Radio Club of McGill University
Call VE2UN

located in Montreal, Quebec, Canada!
Yes, we're very proud to announce that we're back!

In support, MARC (Montreal Amateur Radio Club) has joined forces with ARCMU in putting up a 2m repeater.

The repeater is the original VE2BG station and is now located on top of Burnside Hall at the corner of University and Sherbrooke streets. It has an effective output of 25 Watts.

All previous members as well as all amateurs are welcome to join! Previous members are encouraged to make yourself known as we're trying to re-establish lost contacts.

If you have ANY questions, feel free to mail me at

silver@ee470.ee.mcgill.ca   or
lmcansi@noah.ericsson.se

Thanx, and 73's!

Quicksilver! VE2HHS

Someone is visiting from Russia for 1 week and her husband
asked her to try to buy a pair of walkie talkies. I hate to
see her waste money as everything is so expensive here.

Please excuse the corss posting as I do not read these
newsgroups normally. Follow ups to rec.radio.amateur.misc
please.

1)Are the walkie talkie CB frequencies legal in Russia?
2)Would walkie talies be confiscated if she tried to
bring them in?

Question #2 is much more important than #1 as everything
may be illegal in Russia, just a step ahead of the US. ;-)

I'm just trying to so someone a favor.

Hello.

I'm trying to learn Scottish Gaelic, but I have no one to speak it to
me. Ergo, I have no idea how it's supposed to sound.

Fortunately, I have a ham radio license. If there's anyone out there
who speaks the language who can meet me on the air sometime, let me know.

Scott (really. You should here the story of how I got that name.)

jfw@ksr.com (John F. Woods) writes:
:
: I don't have a direct answer to either question, but the probability that
: US CB walkie-talkies would be legal to operate in Russia is vanishingly small.
: Most countries (in the West, anyway) insist that CB-style radios operated in
: their countries be certified by their country's radio administration (FCC in
: the US, DOC (?) in Canada, etc); in particular, a US CB radio may not be
: legally operated in Canada, nor vice versa, despite the fact that the only
: "component" which is different between two models may be the certification
: sticker on the back.

The US and Canada have reciprocal licensing. That means that a US citizen
may operate his US made gear in Canada without any problems. The same is
true for a Canadian citizen visiting the US.

It may be illegal for a Canadian to use a US made radio that has not been
certified in Canada.

Bill

WOOPS!

In relation to the message that I posted last week concerning ARCMU (Amateur Radio Club of McGill University) being back on the air, I made a mistake - and please don't shoot me, as I was under the impression that I was right at the time.

In that letter I said that ARCMU was North America's oldest University Amateur radio station - or something like that. Anyways, ARCMU is Canada's oldest university amateur radio station, not North America's. So see if y'all can forgive me.

I found out by checking in the 1972-73 student handbook, so once again, I apologize for the mistake. But hey, we're back in action!

Our next meeting is Wed. Nov. 4 at 7pm in MCRCIM (McGill Research Centre for Intelligent Machines, located in McConnell Engineering Building) room 437. ALL are welcome! We'll also have a tour of the VE2BG repeater, located on Burnside Hall.

Cheers and 73's!

Quicksilver!

ok, here is my question, i had a prototype board made for me from some software that i was using. ps the software is supercad ($99 for the pc and for hobbyist/semi-professional it's REALLY good!) but when i got the board i realized i couldnt solder ic plugs (and other various components) to the board because for a prototype they dont plate through the holes (or via's) so therefore when i stuck the socket on, i could solder the back side but not the top because it was right against the board. and you need to solder both sides other wise the coneection just isnt made.

What is the usual method for soldering on both sides of the board for components like these on prototype pc boards???

>Size is 7.5 x 13 cm G10 1.5 mm thick, double sided.

In Ottawa, we get ours done at:

Brock Circuits Inc.
101 Schneider Rd,
Kanata ON,
K2K 1Y3 (613) 591-7321

We supply them with the masks (printouts) from an epson printer, as produced by some PCB layout software, and they make the double sided board. Pretty cheap too, about 30$/board in quantities of one (15x30cm).

Neat!

We haven't been able to trace it back any further than that, but we do references to a club as early as 1913 and wireless telegraphy experimentation as early as1898 or so, but alas, no paper trail...

Can someone post complete info on HR73 and companions?  I mean like, a text of
it, and Congresscritters that have backed it, etc.  I would like to start a
letter writing drive and need the info.  If you are getting this in
r.r.a.policy, I don't usually read the group, so use email please!

Thanks...

Usually, you avoid designing boards which require soldering to inaccessable pins. Most wiring has to go on the back of the board, with occasional traces on the component side as jumpers. Through-board connections can be made with rivets (Weller just came out with a little kit for doing something like this) or with small bent wires. You may have to allow more board space ("real estate") for the wiring with this approach; it's not the way to do dense boards.

If your boards are too complicated for that approach, it's probably time to go to boards with plated-through holes, even though it's substantially more expensive. All serious work today is done with plated-through holes.

Awhile back, I posted with questions about the General code test. Thanks to all who responded. One gentleman even suggested that I attempt the Extra Code first. I took his suggestion and missed it by only one question; thus I recommend this strategy to anyone. I did pass the General code fine though, in fact it would have been a perfect paper but I put the answers to questions #1 and #2 in #1's blank.

Thanks again... Now, off to study for Advanced next Sunday. Oh, and another question. If I am going to take a test before I receive my new license, do I just bring ALL the CSCE's and stuff?

In article <Bx4Hzu.7zo@ais.org> tim@ais.org (Tim Tyler) writes:
-    One of the main uses for ham volunteers in such a scenario would be as
-communications liason at emergency shelters such as schools.
-
-   My topic of discussion will be Shelter Communications, & I'm soliciting
-advice on what all to cover.

While I haven't worked severe weather nets, I have handled public service communications for various events here around Boston. This is a list of suggestions off the top of my head.

Spare batteries and a charger. Bring a pack that handles alkaline batteries, since you can often get them in a pinch. 2.5-5AH gel cells work nicely. Car batteries aren't so good - marine/RV ones are better. Watch out for hydrogen generation while charging them, and insulate the terminals. Don't use gasoline generators indoors...

AC power supply, sufficient extension cord, power strip - save the batteries for when the power fails.

Standardise power connectors on everyone's rigs and have sufficient adapters. This way, you can easily plug any rig into any supply. The ARRL recommends the 2-pin molex connectors that Radio Shack sells. Cinch Jones or Anderson Power Pole connectors are also good choices. Make sure everyone agrees on polarity!!

A flashlight with spare batteries - Check the batteries every few months so you don't get caught with dead ones

Coax (50' of RG58 is about right) with adapters for BNC and PL259.

A magmount or clipon antenna, or maybe one of those coat-hanger quarter
wave groundplanes

Headphones, possibly an external speaker, spare radio, regular FM (3 meter)
radio, possibly a scanner, especially one that can get NOAA weather

Paper, pens, radiogram forms

Water, granola bars, etc. Often there isn't much food available, so it is
better to have your own.

Appropriate clothing (layers, warm enough to go out and fiddle with the
antennas)

If you have regular shelters, many of these items can be stored on site.
If you have permanently mounted antennas, keep a spare on hand just in case
the weather kills it.

Have a pre-announced frequency where people can find the net, and have
the net control call for checkins. This way, the hams can know where to
look to see if they are needed. Also, have occaisional dry runs so you can
find out any problems before the emergency hits :-)

Hope this helps.
/mike

Here are some items from our RACES checklist, plus a few more as a result of lessons learned from Hurricane Andrew. Obviously, a lot of this stuff is geared to a warm weather climate, but there may be others on the net who live in warmer areas.

Please feel free to add to the list.

Radio Equipment:
Two meter HT with extra bateries, ac adapter, charger, microphone
Adapters for various power sources- cigarette ligter, locally agreed upon standard connector, etc.
External antenna- ground plane, small beam
Extra coax cable
Antenna mast- wood, pvc
110 volt extension cord and 2 prong to 3 prong adapter
110 volt to 12 volt DC power supply
spare fuses
RF adapters- BNC to UHF, etc.
110 volt generator and extra gas

Operating and Personal Supplies
Tools
Officail identification
Cash, credit cards
Portable broadcast receiver and extra batteries
Toilet articles- shaver, toothbrush, toothpaste, soap, feminine products, toilet paper, etc
Rain gear
Flashlight
Matches/lighter
Tarp or plastic sheeting
Rope
Insect repellent
Medications- perscription and OTC
Local maps
Clipboard or notebook
Folding table
Portable television
Camera
Sleeping bag and a sheet and/or blanket, pillow
Earplugs
Sunglasses
Sunscreen
Hat
Change(s) of clothes
Gloves
Towels
First aid kit
List of important phone numbers
Pens and/or pencils
Folding chair

Potable water
Food
Eating utensils
Can opener

If you are going to be operating from a shelter or a widespread disaster area and you won't be able to go to "civilization" to sleep and eat, prepare to live in a shelter.

More information is available in the RACES archive on ucsd.edu in the hamradio/races directory.

Hello netters !

As a foreign student, I would like to know wheather I can enjoy radio ham. I was a member of HL0R(sogang university amateur radio club) in Seoul, Korea during 1982 - 1986.

So, I would like to know what kind of procedure do I need to follow, any association etc .
Thanks in advance.

Originator: jason@studsys.mscs.mu.edu

I just passed my Advanced class license test.  I am interested in becoming a VE
(our local teams are low on numbers); what is the procedure for getting
registered with the various VECs?

Hi,

I have some central questions about connecting two hosts via some protocol, without using the telephone-net :

I want to connect two or more hosts (running Unix) with either TCP/IP or ka9q or something by transmitting the data 'through the air'!

So I wanted to know, what hardware equipment I will need, and I also wanted to know what is the correct term for this (ham-radio? packet-radio? cb?)

Anyway, I don't want to spend too much money on the radio hardware (less than DM 300, that are US$ 200).

I intended to use so called CB-units (don't know the correct english term).

So, if you have some material about this or if you can answer my questions or if you can tell me where to find a FAQ for tis group, please emal me or post to this group...

I am looking for some mail order stores or discount stores that sell high end short wave radios at a discount. In the low to middle price range, SW radios are available at several mail order/discount stores at a deep discount compared to the list price. For example, Sony ICF-2010 has a list price of $450. However, I found it advertized in Sunday New York Times for $300. Are similar discounts available on high end SW radios such as Drake R-8, Kenwood R-5000, Japan Radio NRD-525, or Lowe HF-150? I called some of mail order stores that carry advertisements in "1993 Passport to World Band Radios" (Grove, Electronic Equipment Bank, and Barry Electronics). On a $1000 list price, their discounts are only about $50 to $100. Are there any other stores where one can get the high end radios at a greater discount?

Please respond by email. If there is sufficient interest, I will post a summary to the net. Thanks.

Does anyone have any good plans for a voice activated or volume activated switch (admittidly I am not sure if this would be amplitude or voltage).

I need to switch two channels on an intercom system, the first gives priority to a normally squelched source over that of one that is normally on. The second gives priority to voice over audio that is normally on.

Ideally I would like to control the voice activated unit such that I can set the system so it will activate (go high) only after the voice has been => a given amplitude/gain/volume (?) for a given time (.2 seconds or so). By doing this I hope to eliminate much of the noise from someone coughing into or rattling the mike. I would also like to be able to control the voice drop to shut off time.

Any references to Ham-radio, electronics, data manual, project, or other circuit sources would be greatly appreciated.

Thanks,
Scott

Try any recent edition (from the last 10 years or so) of the "Radio Amateur's Handbook", published by the American Radio Relay League (225 Main Street, Newington, CT 06111 - 203-666-1541), which generally has exactly what you're looking for on this subject.

Several years ago, a lot of hams were trying to add VOX circuits to some of the older gear that weren't built with it. But, the circuit should be readily adaptable to your needs, and the text should help.

I suspect that there may be an amateur radio club in your vicinity, if not actually on campus, so you might be able to borrow the book and get some advice/help at the same time. If you call the ARRL, they can probably give you the names of some local amateurs out there. (If you weren't aware of it, the ARRL is our national club. In fact, some of their employees have Internet addresses, so keep an eye on this group and rec.radio.amateur.misc.)

I'm also interested in a VOX circuit. Could someone send these to me also?
I have PostScript Capabilities, so PostScript files are good here. Thanks!

First, the CURRENT news group is rec.radio.amateur.misc

Check the MC2830 Voice activated Switch from Motorola, I believe they sell for
98 cents.

Tom

I just looked in the "ARRL Handbook for Radio Amateurs" and the only reference it has on VOX is that it states that "A transceiver equipped with VOX..." It has nothing on design or any circuit diagrams. This is the 1993 edition of this book, BTW. (Pages 13-10 to 13-11)

Yes, there are several here in the Dallas/Fort Worth area. I'll ask my class teacher (I'm currently learning) about the VOX circuit.

I need a schematic for a Zenith TransOceanic Royal 7000 receiver (late 60's 11 band solid state portable). Any suggestions on where I might be able to aquire one would be greatly appreciated!

Subject: Request: Modification instructions for Radio Shack HTX-202.
Lines: 12

I am making this post for my nephew who doesn't have access to Netnews. He currently has a Radio Shack HTX-202, 2-meter radio and was looking to make modifications. If anyone has any instructions for modifying the frequency or other modification information regarding the HTX-202 it would be greatly appreciated. Information can be sent directly to me and I will forward to him. He has mail capability, but not much else.

Thank you,

George Newell

Announcing. . . Announcing. . . Announcing. . .Announcing. . .

CELEBRATE LIBERTY!
1993 LIBERTARIAN PARTY NATIONAL CONVENTION
AND POLITICAL EXPO

THE MARRIOTT HOTEL AND THE SALT PALACE
SALT LAKE CITY, UTAH

INCLUDES INFORMATION ON DELEGATE DEALS!
(Back by Popular Demand!)

The convention will be held at the Salt Palace Convention Center and the Marriott Hotel, Salt Lake City, Utah. The business sessions, Karl Hess Institute, and Political Expo are at the Salt Palace; breakfasts, parties, and banquet are at the Marriott Hotel.

Marriott Hotel room rates are $79.00 night, plus 10.5% tax ($87.17 total). This rate is good for one to four persons room occupancy. Double is one or two beds; 3 or 4 people is 2 beds. You can make your reservations direct with the hotel (801-531-0800), or you can purchase your room through one of MGP's payment plans. MGP will provide assistance in matching roommates if requested.

August 30, 31, Sept. 1: Everything You Always Wanted to Know About Winning Elections, but Didn't Know Where to Ask!

Three days of intensive campaign training conducted by Sal Guzzetta, a 25 year veteran of more than 200 campaigns. Students receive 990 pages of professional campaign manuals. Everything from strategy and targeting to opposition research, fundraising, and field operations.

Price: $150 if purchased by May 1, 1993
$175 thereafter

August 31 and Sept. 1: Platform, Bylaws, Credentials and National committee meetings.

Shoot out in Salt Lake! PLEDGE versus Committee for a Libertarian Majority. Will the party's membership and platform definitions change? Is compromise possible? The Platform and Bylaws committees are responsible for making recommendations to the convention concerning changes in those documents. At this convention, the party will only consider deletions to the platform. The Convention Rules would have to be amended by a 2/3 vote to change this rule.

The meetings are open to the public. There is no charge for attending.

Sept. 2-5, 1993: Celebrate Liberty! Begins
Political Expo Opens

Sept. 2, 1993: 9 AM -- Credentials Committee report to the delegates.

10:30 -- Gala Opening Ceremony and Keynote Address by Russell Means.

1:00 -- After lunch break, convention business continues (see "Standing Order of Business" from the "Convention Rules of the Libertarian Party" at the end of this document.

Karl Hess Institute of Libertarian Politics Begins, runs in tandem with the business sessions.

Sept. 3, 1993: Dawns Early Light, Green Dragon Inn (morning and evening), with Karl Hess Institute and convention business in between.

Sept. 4, 1993: Dawns Early Light, Freedom Rock '93, Karl Hess Institute, convention business.

Sept. 5, 1993: Dawns Early Light, Convention Banquet, Karl Hess Institute, convention business, Joyful Noise.

ACTIVITY DESCRIPTIONS:

DAWNS EARLY LIGHT	Three great convention breakfasts to start your days right, featuring science fiction author L. Neil Smith, psychiatrist and author Dr. Thomas Szasz, and South African Libertarian leader Frances Kendall.
GREEN DRAGON INN	"Opening night" party, named after the famous inn where Sam Adams and his crowd plotted trouble for the British over pints of ale and beer. Music, food, drink, and comedy.
FREEDOM ROCK '93	Free downtown rock concert Friday night, with drum circle, comic Tim Slagle, Middle Eastern dancer, reggae, and local classic rock-n-roll bands. Will be widely publicized in the local area. Major outreach opportunity.
BANQUET	Vivaldi and Mozart, fine dining, in the elegant Marriott Grand Ballroom (black tie optional). Dancing follows.
POLITICAL EXPO	Exhibits and vendors. FREE admission. Event will be widely publicized in local area for maximum draw. Major Outreach opportunity.

KARL HESS INSTITUTE OF LIBERTARIAN POLITICS

Workshops, speakers, roundtable discussions in these areas:

LIBERTY: NEXT GENERATION	High school and college age Libertarians talk about what matters to them and the 20-something generation.
AGENDA 2000	Considers key issues of the 1990s. Environment. Health Care. 21st Century Economics. Drug War. Second Amendment. Social Services. Foreign Policy. Crime & Violence. AIDS.
THE GREAT DEBATE	LP Strategy and tactics. Media. Ballot Access. Initiatives. Feminist Issues. Presidential Campaigns. LP Elected Officials. Grassroots. Early look at the 1996 presidential nomination.
VALUES FOR THE 90s	Community. Children. Abundance. Home Schooling. Religion and Liberty. Race.

CAMPUS FOCUS	Organizing. Academia. Blue Collar Youth.

CONVENTION PACKAGE DESCRIPTIONS AND PRICES

TOTAL EVENT:	All activities, Aug. 30-Sept. 5, $400, including 3 day candidate training
Full Celebration:	All convention activities, Sept. 2-5, $300
Late Riser	No breakfasts, everything else Sept. 2-5, $250
Thrift	No breakfasts or banquet, $150
Issues Focus	Karl Hess Institute, $125
Basic	Convention packet, souvenirs, two Karl Hess Institute speakers
Free	Political Expo, Access to convention hall, Keynote Address, Joyful Noise, Freedom Rock '93, three free outreach speakers.

PLEASE NOTE:

-- PRICES INCREASE MAY 1, 1993

-- Special student prices are available to anyone under 25 years of age or who is enrolled in a college or university.

-- Six and seven month payment plans are available which can include housing (if requested).

-- To add the three day candidate training to any package below (except "Total Event"), add $150 to the price.

-- All prices are in U.S. dollars.

-- Advertising is available in the convention program; exhibits and sponsorships are available for the Political Expo. Free Political Expo admission and MGP promotions will draw visitors from the surrounding community (one million people live within a 30 minute drive of the Expo).

-- If your special interest group, organization, committee, or cause would like to schedule space for a presentation, contact us.

-- MGP conducts a drawing each month and gives away FREE hotel nights. The sooner you register, the more chances you have to win.

-- Roommate match service available upon request.

OTHER EVENTS:

"Anti-Federalist Two"	MGP sponsored writing contest. June submission deadline. Contact MGP for prospectus.
"The Libertarian Games"	Friendly competition -- marksmanship, computer programming, chess, maybe more.
Libertarians for Gay & Lesbian Concerns	Business meeting, social night, sponsored by LGLC.
???	YOUR EVENT CAN BE LISTED HERE. Contact MGP for details.

ATTENTION COLLEGE STUDENTS!

Special discounts are available for college and high school students. We will work on casual housing opportunities for the "Poverty Caucus". College Libertarians will meet at Celebrate Liberty! and discuss the future of their movement on campuses. Contact MGP for more details.

Hi all-

I'm a ham'er to be. I've been studying the ARRL book "Now You're Talking with HAM radio" for the last few weeks. I'm almost done reading it all and will start reviewing and studying the questions before I take the test. I'll be taking the Technician FCC exams parts 2 and 3A.

What I would like to know is there a program on the net that will randomly generate sample tests from the official question pool? If not, I was thinking if anyone has the questions in electronic form, that I could write a short program to read in the questions and output sample tests.

If you know of such a program or where an online copy of the question pool is, please email me.

Thanks,

Matthew.

For MS DOS, Autoexam by Rich Bono (NM1D?) is a nice piece of shareware.
It does exactly what you are looking for. I think the question pools
are also available from various places.

Download AUTOEXAM.ZIP and use pkunzip or a similar program to unpack it.
It comes with the question pools & documentation. The only thing
you will need is a copy of the ARRL "Now You're Talking" or W5YI's book
to get the figures. AUTOEXAM doesn't have any graphics. When the
question involves a diagram, the Figure number is given, so you can
look it up in N.Y.T.

The zip file also includes AUTOCW, which will run CW practice in various
modes.

Good luck... Hope you pass the test soon!

73,

Jim Morgan WX4D/3
jvm@aluxpo.att.com

PS: almost forgot: AUTOEXAM.ZIP can be downloaded from various places,
one of which is wuarchive.wustl.edu (pub/hamradio directory I think).
Another way to get it is via KA6ETB's mail server. Send mail to
HAM-server@grafex.Cupertino.CA.US and include the line:
get /hamradio/exams/AUTOEXAM.ZIP uue

You will receive mail with AUTOEXAM.ZIP uuencoded. You can specify
"xxe" instead of "uue" for encoding with xxencode instead of uuencode.
You have to use some kind of encoding to send binary files through the

mail.

The word INDEX on a separate line will cause the server to send you
an index of all the files he has available.

Good luck & 73 de WX4D

I would like to design my own QSL card and I was hoping that some fellow
hams could tell me here about great QSL cards that they have received.
I got one from Yugoslavia that showed a ham in bed with a buxom woman
and him asking the other ham to QRX for a minute as he was busy. 8-)
For some reason my wife didn't like that one. 8-) Does anyone have
any good ideas for QSL cards or ones that they particularly like that
they could share with the net and myself? 73!

Is there really need for a transmatch if the antenna is optimally made?

And if not:

* Any hints for producing such an antenna for 15 meter? 20 meter?

It should be: (yes, this is a WISH list for santa claus)

* Small when collapsed. It may very well be long when rigged.

* Water persistent

* Be of light weight.

* If possible, not expensive.

* Easy to carry (Falls under point 1)

* NOT necessary better than a dipole, but NOT worser.

I'm going to use it with a 15m QRP TRX while "trekking" and am not very glad to have yagis with me :-)

Any suggestions?

SM7TUS

Magnus

|>The FCC regs allow identifying in the 3 specified digital codes:
|>Baudot, M**se, and ASCII.  Can I send M**se at 2.4E6 wpm?  :-)

The rule-of-thumb is that M**se requires approx 4*(wpm) bandwidth.
So, if your channel width is 4*2.4E6 = 9.6MHz, go for it.  :)  :)

>As for speed, when you're doing a QSO in Morse you can go as fast as

You're forgetting that 100KW is the max ERP in most of the country. New York city stations were allowed an increase a few years ago due to the intermod, they effectively have about 70 KW now.

Due to a fire at the Empire State Bldg. two years ago, I was able to pull in Philadelphia during a late spring afternoon on the adjacent channels. It might not seem like such a fete but I am in downtown Manhattan for one, some of the stations were back on from ESB with almost full power from generators AND the stations from the World Trade Center were not effected. I'm closer to the WFC than the ESB and was using Rabbit Ears.

A power failure last year that knocked out the WTC stations, including all VHF and most high power UHF TV, opened up the band so much that a friend in Queens was able to swing his antenna around and pick up stations in Boston, New Hampshire and Maine.

Hi contesters,

I hope you haven't missed the ARRL DX Contest CW last weekend. It was the best contest I have been on for a number of years. Propagation was absolutely outstanding and so was the activity.

We operated Multi-2 as DL4MCF with DL4MCF, DL5MAE and DL6RAI. We had two setups, both were using K1EA's CT and both of them were connected to each other by cable. This was the first time we did this but most certainly not the last. I have always been wondering about the mystic term "Daisy chain", which is mentioned in the manual. This "Daisy chaining" is used to connect more than two computers. I would like to try run CT in a Multi/Multi environment but I wonder how it works. Any suggestions?

Interesting, how many stations have switched to computer logging in the past two, three years. On CW you can almost always tell, when they other guy is using a computer because there is a short moment of silence when you finish your call to another station. We call it the 'K1EA memorial second'.

We didn't use the computer to key the radio as COM1 was needed to communicate with each other and there is no COM2. After having tried both (comuter keying the radio and myself keying the radio), I must admit that I prefer sending CW from the keyer. I am a little faster with that and I can still finish typing the callsign with the left hand while sending with the right hand.

We worked 46 out of 48 states on 40 meters, which is absolutely fantastic for us. I had never worked more than 40 before, probably because never bofore conditions were like that. The only two we missed on 40 were Idaho and Mississippi. 80 meters was good too, but you can't expect much from a wire up 40 feet maximum. At least we finished W1-4, 8 and 9. Even 160 produced some 47 QSOs, also with that 40 feet high wire. 20 was a little worse, probably because everybody was on the high bands during the daytime and on 40 during the night. We are not that well equipped on that band too. We had a 4el monobander up about 50 feet, too low to be good. It is usually outperformed by the TH6DXX at 70 feet, but that one was used for 10 and 15m exclusively.

Here are the raw QSO numbers:

160m	47
80m	172
40m	~600
20m	~590
15m	~580
10m	~720

A final score of around 2.18M was displayed on the screen, a little over the existing EU record for Multi-2. Hopefully nobody else has entered this class in Europe, hi.

How did you do in the ARRL DX Contest?

BTW, anybody have a mail address from K1EA or can forward a message to him? I have found a few bugs in the non-USA version of CT's ARRL-DX-Contest.

73,

Ben, DL6RAI

Hello all,

I find myself in need of a filter that will block (Television) Channel
11 [I think the freq. range would be 198-204 mHz].
I used to have a catalog form a company that carried these and other filters,
but I can no longer find it.

Does anyone know of a place that sells these mailorder?
or better yet in the Philadelphia area (to be picked up locally).

But, either way, I'd appreciate if someone could point me in the right
direction for these.

Also, I'm not sure of how many Db of rejection I will need, and any comments
appreciated much.

If you reply to this in sci-electronics or rec-ham-radio PLEASE
ALSO MAIL ME A COPY, as I'm not sure if I will miss it in the newsgroups.

Thanks much! Have a good one.

First of all, I'd like to give a big public Thank You to Gary Sanders, N8EMR for his many posts of useful info over the past years to this group. If you hadn't noticed, Gary has been posting the AMSAT bulletins, and the RTTY bulletins and bulletins from the ARRL to rec.ham-radio. I think he has kept the S/N ratio acceptable here almost single-handedly.

However, (Ah, you knew that was coming!), we haven't seen any ARRL bulletins in quite a while. Gary, what can we do to bribe you into resuming them? I especially miss those DX bulletins, being a DX type myself.

I have also heard that a certain rec.ham-radio regular from the Seattle area is now writing the Propagation forecast bulletins for the ARRL. Perhaps we can convince him to post them here?

FYI-
I noticed that there is a directory full of ham stuff available via anonymous ftp from apple.com in the directory /pub/ham-radio. It is all Mac software, and includes what appear to be Morse code practice programs, license test drills, and a packet BBS. I haven't unpacket anything yet, so I don't know exactly what it is yet.

If the antenna is resonant on the operating frequency it will have a low swr, hence there is no need for a transmatch. Of course, off the chosen frequency the swr will rise and the question is how good of a match do you need?

Certainly a dipole meets just about all the criteria that you list, except for maybe the last one. Does this mean you want gain over a dipole? How about a wire beam? Or how about a loop or quad type antenna. The quad type antenna has a problem of speaders, but the loop could be erected with the use of correctly placed trees. With a loop you will need a transmatch and with a quad you will need some sort of matching network. I would think the dipole a better choice for backpacking.

Regards,
Jim, WA6SDM

LO-19 BBS Now On-line

At 16 FEB 91 3:13:55 UTC, the LUSAT command stations completed the loading of the file system and BBS. The entire load was handled by LU stations, and the first uploaded message is from Dr. Carlos Saul Menem, LU1SM, President of the Argentine Republic. This brings all three of the "Pacsat Protocol" spacecraft on line, a total of 20 MB of "rotating storage".

Following was downloaded from LO-19:

LUSAT BBS is available!
Finally, all the tests have been completed in LUSAT, and the BBS is available for use by worldwide radio amateurs.
To access LUSAT with PG the PG.CFG file must have the following lines:

```
ao16access 30660   (same as used for PACSAT)
bbscall lusat-12
bdcstcall lusat-11
```

The rest of the commands on PG.CFG are the same as used for PACSAT.
We invite you PACSAT users to join us on LUSAT, and wish you all a lot of fun using this little bird.

73, Marcelino - LU7DSU
AMSAT Argentina - LUSAT Engineering Group.

WO-18 reloaded, TNC Bug Discovered

Chris Williams, WA3PSD, of the WEBERSAT Engineering Team reports that WO-18 was blown back to MBL during commanding earlier today. With the generous help of the microsat command team, the reload is in progress. They expect to be shooting pictures again by early next week.

Bob McGwier, N4HY, reports that by modifying the Phase Set Point parameter on LO-19, significant improvement to the eye pattern and I/Q channel separation was realized. During the next Wednesday's Experimenters day (20 February 91), provided that there are no other higher priority commands which must be issued, Bob plans to modify the Phase Set Point on PACSAT.

There have been some reports that the new version of PG.EXE does not work well with AEA TNCs. Bob McGwier has come up with the winning combination of parameters to make the two play together (nicely):

Place the following commands in PG.TNC:

```
     MON 4
     MTO yes bbstat
     MFROM off
```

and put the following in PGDONE.TNC to restore things

```
     MTO all
     MFROM all
```

RS 12/13 to turn on soon, Software bug keeping AO-21 silent

The newly launched Russian satellite, RS-12/13, is scheduled to become operational in the 20-22 February time frame. If you are not already aware, RS12/13 is piggyback on COSMOS-2123 NAVSAT. The Soviet Space Agency is completing their final checkout of the COSMOS satellite and has requested that the Amateur Satellite not transmit during this time.

There was a brief initial checkout of the RS-12 beacon, robot and transponder immediately after launch and all seemed fine. Once testing on COSMOS-2123 has been done, it is expected that RS-12 will be become operational and final testing of RS-12/13 will be completed.

The transmitters for AO-21/RM1 remain turned off since a command station software problem was discovered. It appears that both satellite transmitters are turned on when the command for a single transmitter is issued. It is expected to take a few additional weeks to resolve this problem.

AMSAT-UK Sponsors 6th Annual Satellite Colloquium at U. of Surrey.

AMSAT-UK is sponsoring a symposium focused on all OSCAR satellites and digital communications. Questions & Answer sessions with various Amateur Satellite experts are planned as are tours of the UoSat command station. As in years past, the University of Surrey will be the meeting place for this colloquium. The following is the preliminary "line-up" of programs planned for the week of July 25-28:

```
     Thursday  July 25th:     International Satellite Day
     Friday    July 26th:     Satellite Sessions
```

Saturday July 27th: Satellite Sessions
Sunday July 28th: Satellite Sessions

For more details on the symposium, contact:

Ron Broadbent, G3AAJ
94 Herongate Road
Wanstead Park
London E12 5EQ England

Tel: 081-989-6741
Fax: 081-989-3430 (24 Hours)

Note that the telephone code for AMSAT-UK has changed. From the United States to call AMSAT-UK replace the 081 prefix with 011-44-81. Contact your long distance carrier for their international dialing instructions.

Check with your travel agent as soon as possible as many of the Airlines are offering very favorable rates to Europe.

Stay tuned to the AMSAT News Service for more details.

[ANS thanks Ron Broadbent, G3AAJ, and Eric Cottrell, WB1HBU, for the information for this bulletin]

OPERATIONS NET SCHEDULE
R:910217/1718z 43803@W3IWI.MD.USA.NOAM [Balto/Wash MD/DC]

HR AMSAT NEWS SERVICE BULLETIN 047.05 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 16, 1991
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule

AMSAT Operations Nets are planned for the following times.Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	UTC	Mode	Phs	NCS	Alt.	U.S. day
24 Feb 91	0500	B	115	WB6LLO	N5BF	Saturday
02 Mar 91	1400	B	209	WB9ANQ	KA5SMA	Saturday
10 Mar 91	0315	J/L	166	WA5ZIB	WD0E	Saturday
17 Mar 91	0400	B	100	N5BF	WB6LLO	Saturday
23 Mar 91	1400	B	216	KA5SMA	WB9ANQ	Saturday

The Operations Net features guest speakers approximately every other week to provide up-to-the-minute information on topics of interest to various sorts of satellite users. Watch ANS for information on guest speakers and topics. On the 24 Feb 91 session, Eric Rosenberg, KD3Q, will be talking about his satellite DXpeditions and AMSAT electronic mail issues.

WA3NAN, the Goddard Space Flight Center radio club retransmits the Mode J/L (Mode B nets will not be retransmitted at this time) AMSAT Operations Nets on 147.450 FM for the Washington DC area amateur community. Questions from listeners can be patched from the club repeater (146.835 -) to AO-13 for the net.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

AO-13 TRANSPONDER SCHEDULE
R:910217/1718z 43804@W3IWI.MD.USA.NOAM [Balto/Wash MD/DC]

HR AMSAT NEWS SERVICE BULLETIN 047.06 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 16, 1991
TO ALL RADIO AMATEURS BT

End of Eclipse Period Marks return to Original Winter Schedule

AO-13 TRANSPONDER SCHEDULE

```
  Mode-B : MA 000 to MA 165 |
  Mode-JL: MA 165 to MA 190 |
  Mode-LS: MA 190 to MA 195 |
  Mode-S : MA 195 to MA 200 | <= Mode B is Off - no swishing!
  Mode-BS: MA 200 to MA 205 | <= QRP on BS please.
  Mode-B : MA 205 to MA 256 |
  Omnis  : MA 240 to MA 060 |
```

This schedule is expected to continue through 27 March 91

The command team requests that you make a specific effort to use QRP on Mode between MA 200 to 205. This is specifically to help those people who are experimenting with Mode S.

The spacecraft attitude for AO-13 is:

BLON = 209.5 and BLAT = 0.7 for 31 December 90

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations. The transponder may be used, carefully, at all points of the orbit except MA 254 - 006 when eclipses occur.

If beacon or transponder signals show signs of FMing, users should cease all transponder use immediately. An APPROXIMATION of the spacecraft attitude for AO-10 is :

```
               BLON = 357    and  BLAT =  3.0  for 9 February 91

Both voice and packet QSO's made by Soviet spase station "MIR" current crew (U2MIR and U9MIR) can be confirmed by UW3AX. The address is: Boris Stepanov, P.O.Box 679, 107207 Moscow, USSR. For direct reply please enclose SAE plus IRC's or equivalent. Please also have patience: no QSO comfirmattion can be made before current crew will be back on the Earth (the expected month is May).

All QSL's for previous U-MIR activity has been filled and sent before March last year. This aplies only for those who sent QSL to U-MIR. They were only some 25 % of logged contacts. UW3AX has U-MIR logs for previous missions in hands and can confirm QSO's.

73 de Boris Stepanov, UW3AX

** End of Quote **
One: the bridge MUST NOT be under automatci control..ANY messages over amateur radio MUST be screened before transmitting!!!!!
Two: FCC PArt 97 sets a maximum speed for stations using automatic CW ider's at 20wpm....sorry, I dont have my rule book handy but it's in there...oh here it is! 97.119 (b)(1) sets the code speed for automatic CW id at 20wpm for all stations!
It doesnt take an armchiar lawyer to read the Part 97 and understand them....In fact YOU are suppossed to possess a current copy of Part 97 in your shack and have read it before operating!
FCC Rule Book published by ARRL is cheap and has complete rules and regs in it as well as plain English answers on rules questions.....
I would suggest you buy one and get to know the rules..

Packet Radio May be Censored After FCC Citation

Strange Way to Note Present's Day, 1991. Wasn't It?

By Frank Bynum [*]

In various groups on UseNetNews there have been discussions by people anxious to see that actions which hinder the free flow of ideas be overcome. A news item was seen to run on CNN which should raise concerns about this matter. Approximately 6 pm EST, Mon 18 Feb., 91, on CNN shown in Oxford OH (near Cincinnati), a report aired about a potentially controversial citation issued by FCC enforcers.

The report was preceded by a teaser before the commercial. 'We will show you', said the anchor person, 'a case where a ham radio operator has gotten into trouble over the Gulf War . . . '

The person who was the focus of the report operated a system for data packet radio relay. He was a Ham radio hobbyist. His system incorporated a desk top computer, specialized software, and radio reception/ transmission equipment. Stations of this type will pick up and then rebroadcast messages. It can work as a "broadcast" mode, using techniques similar to the ones on which cellular telephones are based. A piece of information from one station can be thus rapidly and widely disseminated. Between 10 and 100 messages per day may pass through such a station.

The problem is that he has been issued a citation charging him of violating the terms for his kind of ham broadcasting license. The FCC officials claim that he is not complying with the clause which does not permit any "business use" of that kind of service. The charge cites the fact that his ham station rebroadcasted a particular text message. (He was hot the originator of the message.)

This message requested its readers phone a number, something like 900/oil-peac (a guess, since notes weren't taken). It said that then callers could listen to a taped message about the need for the USA to stop fighting in the Persian Gulf. And, being a 900 number, the fee for the call would be used toward meeting the expenses of the peace group involved.

So, at issue, should the carrying of a message on this man's equipment, which some one else originated, be construed as 'business use' rather than 'hobby use', in that it carried information which would 'serve to promote the financing of a given Cause'? If the charge is upheld, to what degree may it damage to a trend in which rights of personal expression have been assisted by PC communications proliferation?

Are Sysops going to be allowed to act simply as 'common carriers' with liability to rest with only message authors? Much traffic can flow in channels which are automated, involving only minimum intervention by human managers. Much less volume would flow if slowed by the requirement that, in order to avoid penalties, each intermediate sysop had to inspect any and all communications (s)he would pass on to others, not forwarding what there may be any doubts about.

I would not presume to do the equivalent of instructing grand parents how to suck eggs. (I am not yet a ham. But the data communications capabilities in the cited report might aid my future needs.) Hope this hasn't been previously talked to death in this group.

Lobby hard now. Your influence in favor of asserting broad interpretations of individuals' rights may help.

-Frank B.

|----------------------------------10'-----------------------------------------|
```

Here's a pole for you. :-)

Now, I subscribe to QST, 73, CQ and Worldradio. They're all different and therefore all valuable in their own right.

QST: ARRL propaganda, some good projects, lots of news and reference items. The mother lode of ads.

73: Wayne's propaganda, some good projects and news, a refreshing view, an irreverent view.

CQ: Traditionally a contester/dx'er's rag, CQ bought the Ham Radio subscription list last year when Ham Radio went to that great shack in the sky. Ham Radio was traditionally an experiment and construction rag, and we have yet to see whether CQ will keep this alive.

Worldradio: A newsprint monthly. About 32 pages. Some news articles and a continuing series of columns on various Ham Radio related topics.

Wayne always bitches that QST gets the lions share of the advertising, and from examining the other pubs it seems to be true. I think it's important to take at least one of the others, since they provide a counterpoint to the league viewpoint. I'd like to see some of the advertising dollar get spread around rather than having so much of it go to Newington, but only subscriptions will help that.

73 is probably the most all-around magazine, if you can handle "The Carmudgeon". CQ is very fine if you work lots of HF. Less so for VHF/UHF, etc.

Worldradio, at $13/yr, is an easy one to take and provides yet another look at what's going on.

Enjoy.

I posted this question to a bunch of packet radio BBS systems but no answers....

Q. Are there any Packet<->Internet gateways around such that I can
    route mail between a packet station and TCP/IP-Internet-SMTP ?

    Basically, I want to exchange mail between addresses like
     gary@midway.uchicago.edu

    and a packet station like
     ke9zm@wb9mjn.il.usa.na

A. ?

Thanks,
  Gary

Monitoring Times also had a story on this subject. The author of the article
tracked down the transmitter to a US military base in Va. Somehow, they
determined a CIA connection. I don't remember the exact year or issue
but it should be easy to find. Monitoring Times has a number of articles
of this type. Some of the authors of these articles work for the CIA
and they use code names.

The rule Part 97.113(4)(d) states " No station shall transmit music, ..."
the law says NO station.....that includes repeaters! and it DOESNT give you
enough leeway in the example the person who originally asked to allow music on
hold on a rptr! the trustte or control op of a rptr MUST terminate ANY
transmission that violates Part 97...

FCC Part 97

READ them, KNOW them, FOLLOW them!!!!!!!!!!

>Does anyone have any suggestions??

Allow me to be the 100th person to say: Such a modification to a cordless phone is ILLEGAL. These devices operate under part 15 of the FCC rules, which have very stringient rules for power and antenna. If you extend the range of your cordless phone in the manner described you will be in violation of FCC regulations.

Now that I have said this, let me say something else.

Go ahead and put it on a big beam antenna. This way your neighbors for several miles will hear your conversations more clearly on their scanners. And YES trust me, within the range of your UNMODIFIED cordless phone there are probably several DOZEN people with scanners who will be enjoying your conversations.

I am continually amazed that people who own these things do not realize that a cordless phone is a RADIO TRANSMITTER that clearly sends both sides of the conversation over a much greater distance than you might think.

I have heard conversations from over three miles away. Of course I have a VERY good receiving antenna (a Motorola Monitenna) on a 40 foot tower, and it plays like a banshee.

You would ALSO be amazed at the stuff to be heard. JUST AMAZED. Better than ANY soap opera.

OK folks. Come clean. How many of YOU have the 46 mhz phone frequencies punched into YOUR scanner.

Heck. I have one scanner that has ONLY those frequencies in it. What better use for a ten channel scanner without the 800 mhz band! Just let it run all day.

Now. Who will admit that they not only listen to these conversations, but that they LOG them. I have often thought of a CERTIFICATE for the dedicated cordless phone monitor. You get multipliers for names, addresses and phone numbers of the people you hear (when they order a pizza you can score these easily).

Add 100 points for a girl crying because her boyfriend is leaving. 500 points if it is a GUY doing the crying. 1000 points for each drug deal you monitor.

I have heard all the above and MORE.

Yeah. Go for it Duncan.   Go get that cordless phone of yours ENERGIZED with a really GOOD antenna.

And point it EAST.

I might just be able to HEAR *YOU*.......

(please send all "sick sick sick" flames to alt.dev.nul)

Yes there will be audio and video! The flight is NON-classified DOD which
means they just wont talk about the tests on the audio link!
But there will be flight audio and video!
** Quoting Stephen Look to All **
 >There is a segment on NASA Select called 'The Frank Six Show'
 >which plays

 >--
** End of Quote **
As the waiver from the FCC is read, you are RETRANSMITTING their signal...A
FCC engineer at Houston said the waiver allows you to retransmit NASA
audio...if THEY transmit music then YOU CAN rtetransmit them....BUT I think
you have to look at the source..if it's audio to/from the shuttle, that's fine
but audio of a news program, etc NOT carried to/from the shuttle MIGHT not be
```

OK!!! NASA has several audio loops, one of which carries shuttle audio ONLY!!
I think it is on a different subcarrier on NASA select..you may wish to check
into this (Alsoremember you MUST have NASA's permission to carry the audio!)

Since you know the answer both ways, if the question appears on your exam, just ask which way the VE wants it answered - pre 2/14/91 or post 2/14/91. I passed the test before 2/14/91, so I didn't have to deal with this distractor. (and yes, it was too easy.) Now, if I can just pass the code test...

A lot of people responded to my plea for help. Here is a summary of what I received (I have summarized the mail I got).

1. Insulation makes no difference for HF band frequencies. In fact it may be good to avoid accidental contacts to metal or ground.

2. If the front end of the set is not too sophisticated, an external antenna may over load it and hence do no good.

3. The external antenna can still be useful in attempting to receive weak stations. The idea is to use the external antenna far away from house hold sources of noise (which are picked up by built in antenna). Compensate for the overloading caused by the external antenna by reducing the RF gain of the set (my set has a knob to do just that). Hopefully, the reduction in noise will help me listen to the weak stations.

4. Use antenna tuners.

5. If the set is a cheap set (under $500.00 - like mine is), external antenna will not help a whole lot.

Thanks to all those who responded.

Would someone please e-mail me the *electrical* length for the 75 ohm matching
section on a Butternut HF6V vertical antenna. If you don't know what the
electrical length is just measure the physical length and tell me what kind
of coax it is (probably RG-11/U or something)....

I need to make a section up by tomorrow....leaving Saturday for a trip and
realized that the matching section is missing...

Thanks

Hey Chris! Give me a FAX number and I'll fax you the whole book! You are correct on the cost of parts, and power is gotten from the rig though for different rigs, the interface voltage is different...(the C version doesnt use an onboard regulator as the B and A models do!)..I have one installed in my TS680 and have the complete codes and schematic!

Re: 15m QRP hiking antenna

I'd use a resonant wire dipole, made out of #24 (or smaller) wire. If you hike above treeline, take along some fiberglass support rods, insulators, and guys. RG174/U (the thin stuff) would be lighter than RG58/U, and the loss wouldn't be much more for a really short run. All this would coil up into a small bag, and should weigh a couple kilograms.

If you really wanted to match the SWR to 50 ohms, you could build a matching section from 300 ohm TV twinlead. However, dipole impedance varies quite a bit, depending on height and nearby objects.

Ham radio operators have always been responsible for what their equipment is used for. For instance, if person A has a ham radio station, and lets his friend person B speak to someone, and person B starts violating FCC regulations (e.g., swearing), then person A is responsible for stopping this.

The FCC has tended to look the other way when the station is running packet radio, but this will only continue if there is no problem. Was this a single solicitation for a 900 service, or were there several such messages?

This is the same question that sysops have been asking for years. Many of us wonder about this, and what are the limits of our liability. I believe that we have some obligationt to make a reasonable effort to "censor" the posts and uploads of our users. Some examples follow:

* Stolen credit card #'s
* X-rated material on public sub-boards
* Pirated software

But to what extent do we have to go through to insure this. Is it adequate that I read my mail once a day and delete or move offending posts? Should I approve of all posts before they are made?

Do I lose my residential line status if one of my users says..."I need a job"

It seems that we ARE being made responsible for the remarks of our USERS. This is a troubling though.

Agreed! But how does any of that justify calling the Amateur Radio Service "ham broadcasting"? The FCC regulations still forbid "ham broadcasting" to the general public or to CNN!

Steve Look asks if there will be NASA Select Audio/Video for the upcoming unclassified DOD STS-39 flight.

The answer is a definate maybe!

According to the response from a mail messsage posted to the SpaceLink computer, there will not be Select carried.

However, when I downloaded the mission profile, it appeared as though there would be Select available.

As a last resort, I checked with the local gent (NASA-Ames) who supplies Select to the Bay Area. He said that there would be Select for this mission.

If I'm presented with any more information, I will repost....

Meir,

You must realize that one of the functions of ham radio is to "push the edge of the envelope" of technology. Thus, situations can occur (and frequently do) where the technology outpaces the law.

Imagine the situation, if you will, if the voluntary bandplans were legislated and it was in the era of AM. Let's say for the sake of argument, that you are Joe Ham and have come up with the idea of SSB. In this case, SSB would not be allowed.

In another example, ASCII is allowed to be transmitted and is not considered a code. What about in 1967 when ASCII was developed. Clearly, the object of ASCII is not to obscure communication but it is easy to see how ASCII could be considered a code (technically, though, it is a cipher).

Thus, the law MUST change to suit the state of technology. If the FCC sticks to the letter of the current law, a promising technology could be killed. Ham radio has a tradition of developing new modes of communication which is later commercialized. Apple Inc. is trying to get the FCC to agree to let it develop a broadcast LAN. Clearly, packet radio is on the forefront of technology and should be allowed to grow.

IMHO, only the originator of the post should be held responsible for the contents. Packet radio operators should not be held liable. By its very nature, packet radio requires the automatic forwarding of data. The old rules are inadequate for the situation.

02/08/91
INSIDE DX No. 255
436 N. Geneva Street
Ithaca, NY 14850

CLIPPERTON- Kiyoko who recently signed T31KY (went QRT on Feb. 3rd) has returned to Japan. Several readers report that she stated she would be making a trip to this one sometime in April and hopefully will activate it while there, Kiyoko works for a pearl diving firm based in Japan and this is why she travels to all these remote islands. KYFC!!

ITALY- I2UIY and others are planning a major Multi-Single effort in the ARRL CW DX Contest on February 16-17th signing IU8A on 160-10 meters. (TNX I2UIY)

JAN MAYEN- LA1MFA will be signing JW1MFA starting February 9th for several weeks on 80-10 meters on CW and SSB. QSL to homecall.

ST. LUCIA- Bill, K4LTA, and XYL-Ruby, N4FKO, will sign J6LTA and J6LSW from February 13th to March 4th. They will be active on all bands 80-10 meters including the WARC bands on CW and SSB. Bill will be active in both ARRL DX Contests. QSL via NI4M.

MIDWAY ISLAND- A station signing KH4AE was quite active on 10 meter SSB the weekend of January 26-27. Operator's name was Art and QSL route of KM6BI. KM6BI was the old club station on Midway Island and is not listed in the callbook. By the way the suffix BI was for Bird Island the old nickname for Midway. Is this one legit??

LEBANON- Opr. Walid, OD5ZZ, frequents 21223 at 1715Z keeping the pileups flowing smoothly. He uses a 100 watt rig into a 3 element tribander. QSL via P.O. Box 782, Tripoli, Lebanon.

AFGHANISTAN- According to Romeo, UB5JRR-ex YA0RR, who spoke to Jacky, F2CW, and Jacky did not bring equipment with him nor was he able to obtain a YA license as of press time. (TNX K2OLG)

ST HELENA- Dave, ZD8DX, and George, ZD8GT, are in the planning stage to mount a Dxpedition to this one in about 3 months (May?). They plan to be active on 160-6 meters on CW-SSB-RTTY-AMTOR. The operation will last for 1 to 2 weeks. More details when plans become more concrete.

ASCENSION ISLAND- ZD8TG, opr. Tom, was active from here this past week. He was a member of a scientific group that was conducting tests measuring possible changes in the ocean's temperature. A ship neear Heard Island (Jim Smith, VK9NS, attempted to hitch a ride aboard this ship for a possible operation from VK0H but due to limited room aboard the ship was unable too) lowered probes into the sea and pumped 5 KW of audio power at 57 KHz ito the ocean and various monitoring sites thru-out the world took readings (Time for the signal to reach them plus signal strength). These raadings will be compared to future readings and any change in them will signal a change in the Ocean's temperature. Tom will be in ZDB for one more week, try 21270 at 2115Z. QSL via W0IFQ. By the way it took the signal 104 seconds to reach ZD8 from VK0H. Dave, ZD8DX, likes 7070 from 2000-2400Z and 3795 from 0000Z on weekends plus some 160 meter action when conditions permit. QSL via WB2K.

SOUTH COOKS- Joe, VE3CPU, is active from this one now, signing ZK1XO on 80-10 meters. Look for his signals on the low end of the CW bands. QSL via VE3CPU.

SOUTH SANDWICH ISLANDS- George, W8BKP, reports working Travesay Island in the South Sandwich group. The station was worked 2/2/91 on 28008 at 1807Z. This station was also active on 1/16/91 at 2250Z. QSL route is via RB5JBU. According to U5FG who states that there is a USSR station which is active from time to time from the Sandwichess... KEEP Our Fingers Crossed!! (KYFC!) this one is ligit.

ZAMBIA- K1LKI reports that 9J2SZ is active on bottom edge of 20 meter CW after 1800Z. He runs 30 watts into a dipole antenna. QSL this one via SP8DIP.

BURUNDI- SURPRISE!! Lloyd and Iris showed on January 30th from this one signing 9U5QL. So far they have been active on 10-20 meter CW and SSB. The pileups on this one have been huge. QSL via YASME. They will QRT on February 19th.

I believe the term "ham broadcasting license" was introduced by the reporter, not by the ham. In general media coverage it is pointless and counter-productive to try and push the difference between broadcasting and transmitting. It's more than the public wants to know and not essential to the story.

I have acquired a couple of avionics RF amplifiers made by Rockewll
(Collins Division). Unfortunatly there is no infomation with them so
I am looking for someone who might know the whereabouts of schematics
and hand books.
Power Amplifier Type 548T-1
Part # 522-4398-001

This has a single 4CX600J valve, so one could assume
that it is reasonably high powered (if a 4CX250 has 250W plate disipation
and the Eimac series is consistant (although I could find this tube in
any of the books I have). It has servo-remote tunning and is in a compact
rack-mounting module (looks like a number of them go side-by side with
power-supplies. They are about 8in high by 3 ins wide by 18 ins deep,
with slide contacts (coax and power/control) on back.

The power supply module is 110VAC 400Hz 3/phase (yes I'll have to build
a solid-state rotary converter):
Power Supply Type 636W-1
Part # 522-4790-002

I will try Collins in Ceader Rapids but I can imagine that I'll get nowhere.

These are obviously 'avionics' in design and perhaps are of millitary
in origin (although the repair tag says that they are repaired to FAA
requirements (1981))

Any pointers would be GREATLY appreciated.

(Also anyone who has experience in making 400Hz 1500W 3 phase stuff!)

I would disagree with your synopsis in two places.

The "RF" gain control on your receiver is not a front end attenuator, but actually just backs off the automatic gain control (AGC) The AGC control line may , and often is, be applied to an RF amplifier. The type of front-end AGC used in just about every case degrades rapidly as the gain is reduced. Reducing the setting of your RF gain control will actually make things worse !   To gain the wanted advantage you need a passive attenuator (3 resistors !) Some receivers may have an "RF ATTEN" switch, if not, an external attenuator needs connecting between set and antenna.

The value of an antenna tuner needs some qualification, Using an antenna tuner to perfectly match an antenne to a receiver is usually disappointing - it usually makes little difference. The reason such devices exist is that transmitters are, unlike receivers, VERY insistant upon seeing a correct load impedence - the tuner makes an antenna appear to the transmitter as the wanted impedence when it is properly adjusted.

Receivers benefit significantly from a different sort of tuner, usually called a pre-selector, whose function is to pass the wanted signal but to filter out as much of all others as possible in order to reduce overload effects. The high Q loop antenna behaves as a combined antenna/preselector.

Hope this helps

Not true! I looked up the reference, and indeed the Board of Directors considered the idea of standardizing on these connectors (minute 77), but the idea was rejected (tabled).

>   Sources of these connectors are:

>Anderson Powerpole   - Anderson Power Products
>   145 Newton St. Boston, Ma. 02135
>   (617) 787-5880
>SPC Technology A Mode Connectors - Newark Electronics
>   Catalog #108, Page 599

This may be the only source of these connectors. I called up 3 local and national industrial electronic supply houses and 4 electric supply houses, and none of the 7 had ever even heard of Anderson Power Products.

I did find a catalog in our Materials Engineering library here at Hewlett Packard. By the way, only the red connectors are a standard catalog item -- you can get black-bodied connectors, but it is a special order.

If we are going to standardize on a connector, I feel it should be something a little more "standard". Ideally something like a Molex connector, available at any Radio Shack.

someone asked about the FT470 crossband trick, so, from my files:

```
 Msg# TSP  Size #Rd Date/Time MsgID        From   To
 1949 BN   2133   4 0828/2115 45258_K6IYK  KJ6NV  ALL
   Sb: Yaesu FT-470 Crossband Repeater Function
```

If you turn on the radio with the RPT key depressed, the radio becomes a crossband repeater. Try it! Dial up two frequencies you want to crosslink (be sure to pay attention to transmit offsets, if any), turn the radio off, depress the RPT key, and turn it back on. The tone encode/decode flags and the -+ flags will be flashing. When either band's squelch opens, the other band is moved into the primary frequency display and the transmitter keys. Note that the power output is decreased to Low power. One note: the crossband audio isn't great, probably because it's whatever comes out the speaker and gets fed back into the mike. I suppose if you got serious, you could create a short interface cable to plug into the top of the radio.

73's & happy dual/crossbanding!

Collier Chun
NM7B @ WA7ARI

And it does indeed work (I've tried it on mine).

Larry
KJ6NV @ K6IYK-4

But I haven't, so proceed at your own risk. WA2ISE

FT-470 mod extended VHF xmit....

Here's the mod for the FT-470. (I have not performed it myself)
1. Remove Cover
2. Remove Lithium battery carefully
3. On left hand side locate some empty vertical pads, one above the other. It should be marked as R-69. There is also a chip resistor R-67 that is just below it to the left a bid.
4. Place a solder jumper across the two R-69 pads.
5. Reinstall the lithium battery.
6. Closeup the Radio.

7. Turn the radio of. While pressing down the up and down arrow keys, turn the radio back on.

Note: This mod only opens up the VHF transmit frequency range beyond 140 to 150. The automatic repeater offset will be defeated so you will have to enter the +/- offset yourself.

73's   Bernie NU1S @ K1UGM

Note: I haven't tested this, proceed at your own risk. Don't transmit out of band, else you might get a fine or even do time.

I have recevied enough enquiries about mods for the Yaesu FT-470 hand held, that I have decided to post what I know.

(This is a transcription of a letter that I received detailing the CPU programming jumpers that were found experimentally by Ed Boakes, WB3FLD.   Keith, N7HMF)

Dear Keith,

A little while ago, I came across a Net News item from you about the Yeasu FT-470 handheld. You asked if anyone knew how to make it receive the public service band just above the UHF amateur band. Well, I've figured out how to do that. However, the bad news is that when you strap the unit for this mode, it only transmits from 430 to 440! Oh, well.

I gave you a phone call a week or so ago, but it seemed that we kept missing each other. Anyway, here is what I've learned about the FT-470: I have located a total of eight straps, the four which you had written about, to the left of the lithium battery, and four others located under the flat white cable that interconnects the upper half with the lower half.

YEASU FT-470 STRAPS

R69	Vertical, at the 10 o'clock position by the lithium cell
R68	Horizontal, to the lower left of R69
R67	Horizontal, just below R68
R66	Horizontal, just below R67
R71	Vertical, the leftmost of three, to the left of the upper corner of the ribbon cable connector.
R70	Vertical, the center of three of which R71 is the leftmost
R72	Vertical, the rightmost of the three
R74	Vertical, to the left of the ribbon cable connector, below the three. (Note that R74 is below an unpopulated capacitor that does not have a C number.

There is no R73, or at least it is not on the circuit board and it is not in the schematic. And, yes, the order of those three is indeed R71, R70, R72, left-to-right.

R70, R71, R72 select the mode for the UHF portion of the FT-470. The choices are:

UHF CHOICES

R71	R70	R72	Rx and TX	Receive only
0	0	0	430 to 440 Mhz	430 to 500 Mhz
0	0	1	430 to 450 Mhz	
0	1	0	430 to 440 Mhz	
0	1	1	432 to 438 Mhz	
1	0	0	430 to 440 Mhz	
1	0	1	220 to 225 Mhz	
1	1	0	430 to 440 Mhz	
1	1	1	210 to 235 Mhz	

R66, R67, R68 and R69 select the mode for the VHF portion of the FT-470. The choices are:

VHF CHOICES

R66	R67	R68	R69	Rx and Tx	Receive only
0	0	0	0	144 to 146 Mhz	130 to 180 Mhz
0	0	0	1	144 to 146 Mhz	
0	0	1	0	1260 to 1300 Mhz	
0	0	1	1	1240 to 1300 Mhz	
0	1	0	0	140 to 150 Mhz	130 to 180 Mhz
0	1	0	1	140 to 174 Mhz	
0	1	1	0	303 to 343 Mhz	
0	1	1	1	8AL to 242 Mhz	
1	0	0	0	144 to 148 Mhz	

1	0	0	1	144 to 146 Mhz
1	0	1	0	1240 to 1300 Mhz
1	0	1	1	404 to 444 Mhz
1	1	0	0	140 to 160 Mhz
1	1	0	1	1260 to 1300 Mhz
1	1	1	0	101 to 141 Mhz
1	1	1	1	1R3 to 158L Mhz

(Note: the receive only ranges are enabled by powering up the unit with the up and down arrow buttons depressed...kjm)

When there is more than one combination which has the same frequency range, the difference is the default step size and/or the default repeater offset. Of course, choices that do not match the VCO and filters do not actually transmit or receive on those frequencies. A particularly strange example is that the VHF side of the set can be set to tune from 404 to 444 Mhz, but again, it won't actually lock. Even in the 101-141 mode, the VHF VCO will not lock - this must be for use with some other sort of VCO (It looks like this would cover the aeronautical band rather nicely.) There are two really wierd VHF settings, those for 8AL-242 and 1R3-158L. These must be for use with some other LCD controller - it displays truly unusual and non sequential thins when stepped through the "bands".

R74 seems to have something to do with something like selecting the IF frequency, or something else like that that. When set, it really screws up the VHF reception.

My technique for determining these straps is to remove the straps that come in the unit, solder wires to each pad, run the wires out of the unit to a bank of DIP switches, screw the unit back together, and then go through all of the DIP switch combinations. I usually use a stereo microscope and 30 guage wire for this. Since I didn't try powering the unit on with every combination of keys held down for each DIP switch combination, there may still be other secrets possible.

Since I was looking for something like receive and transmit from zero to infinity, and I didn't find it, I kept looking until I got bored and wanted to button the thing up and start using it. I determined, from studying the schematic, that there should be a hiddem strapping diode from CPU pin 2 to CPU pin 22. I installed one, but nothing changed. In fact, changing it and powering the unit up did not cause a reset. Therefore, I concluded that this really wasn't a mystery strap, afterall. However, there could be others. I'm trying to get a data sheet for the CPU, from Hitachi, to see if any of the grounded pins are actually I/O pins -- they might be good candidates, particularly if their traces are routed in such a way as to be easily accessible for cutting.

I've learned that one of the ways to get some of the other, new Yeasu handhelds to go out-of-band, involves dumping data out of the clone port, editing the data, and then dumping it back in. I called Yeasu and asked if the FT-470 could be cloned. They said no, so I ignored them. I haven't figured out how to get it to dump data, but I believe it will accept data. The clone mode is entered by powering up the unit with the F key held down. (It's also a neat way to see all of the indicators on the LCD!) The data must be presented in the ring ("right channel") of a stereo 2.5 millimeter plug which is placed into the mic jack. This is cryptically marked on the schematic, anyway. However, I have no idea what the format for the data should be. If you come across this, I'd love to know. This may be the trap door to getting the rig to receive and transmit in more interesting places.

Have fun with you FT-470!

Yours Truly,
Ed Boakes

Several interesting things that I have learned since I received this letter... According to the guys at Yaesu, the engineers in Japan appearantly wrote the full UHF rx/tx out of the ROM on purpose.

The unit does a very good job as a cross-band repeater.

To enable this, turn off the radio, hold the RPT key and turn on the radio. Now, anything heard on EITHER band will be re-transmitted on the other band. There are, however, a few problems.

First, there is no real internal path for the audio to get from the receiver to the transmitter, so you either have to modify the radio, to provide a path, or do what I did which is build a short loop back cable connecting the tip of the earphone jack to the tip of the microphone jack like this:

```
     <---------/\/\/\/\/\/\/--------->
                  100K
```

This is the way I did it, others I have talked to have used either just a resistor like me or a small capacitor, or a combination. On my radio, this value of resistor gave me a good range of tranmitted audio levels by adjusting the volume control.

The other small problem is that the radio automatically selects low power on transmit in this mode. This is probably because of the lack of a real duplexer.

After looking through the service manual, it became appearant that the small mystery hole on the side of the radio with the rubber plug was originally intended for an external power jack. I have not yet asked Yaesu if they will sell the jack for that spot. I also have no idea why they omitted it.

All in all, I still love my FT-470. Its a great little radio.

```

Hello FT470 owners... I asked a few weeks ago about mods for the FT470 to make it receive and transmit on additional frequencies. I own(ed) the European version which caters for 144-146 & 430-440. It now transmits and receives 140-174 & 430-440, with additional receive coverage 440-500 MHz! The mod was fiddly as the chip resistors are the size of a pin head. You'll need a fine tipped soldering iron and about 2 hours of patience. Here's how I did it...

```
For 2 metres..  locate R66-69...      R69
which are located at 10 O'clock       |
to the lithium battery.           R68-(lithium
R69 is vertical, R66-68 are       R67-(battery
horizontal.                       R66-(cell
```

The combination you want is: R66 & R68 = 0; R67 & R69 = 1.

Mine came with R66 & R69 set for Europe so I just moved the resistor from position R66 to position R67.

For UHF, locate R70-72 to the top left of the ribbon cable. These are vertical and in the order:

```
     R71 R70 R72
```

The combination you want is: R71 & R70 & R72 = 0.

Mine came with R71 set for Europe so I just took the resistor out and have
stuck it to the back of the battery (in case I need to convert back).

If anyone disagrees with these mods and think I've done something wrong,
let me know a.s.a.p.

Cheers & 73
de Peter G6ZYT.

I recently went to a MARS meeting in my area. I was told that the MARS
freguency I needed was below 144 mHz. A person with a Kenwood TH-75 tried
with his radio, but found out he needed to have his radio modified.

I tried with mine and found out that it got down their on its own without
modifying my FT-470. While thinking I just got to understanding how
Yaseu works (like what they did to the 440 mHz side of my HT), I got a bonus
with having to pay extra.

If you try it on the FT-411 you won't be able to go below 144 mHz.

Well, I've decided to join in on the fun and purchase an HT.

It seems that a lot of you out there already have an HT and I can't
think of a better place to ask for opinions. ;-)>

I've narrowed down my decision to the IC-24AT and the FT-470. Both of
these look like real whiz-bang little toys. The FT-470 is a lot
cheaper, but a little bigger, and heavier. The IC-24AT can do amazing
things with a few mods but would lighten my wallet quite a bit. So
which has the most bang for the buck?

If you have experience with either of these two babies, I'd really
appreciate it if you would send be a note on what you think. I'll post
a summary of the results.

Thanks in advance,
-Tom

I have the 470, and I like it. The 24AT was too much for my wallet,
anyway. With the correct key sequence, the 470 does cross-band repeat (though I
don't need this very often). I do use ALL the memories on 2M, and about half
of them on 440. The 2M receive opens up easily to 130-180 MHz, thus several
of the memories are police, fire, NOAA, etc. A buddy put the rig on his $10k
service monitor, and was astonished at how hot the receiver was. < 0.1 uV at

146 meg. Lighted keypad is nice, though I sometimes wish the lamp button was push on - push off instead of momentary. Dual-band rubber ducky works well. It would be neat if the 440 receive could be extended, but I haven't seen any postings of such a mod.

Some 470 users report intermod problems in high-RF environments; I don't often have that problem, but I hear that Yaesu will do a free mod for those that do. It allegedly involves moving one of the IF's and realigning. The new ones probably don't need the mod at all (already done at the factory).

Signal reports have been consistently good with this unit, and it's built fairly small but solid. I use the 7.2V 600 mAh (FNB-17) pack and the stock vinyl case. Around here, I almost always use lo power, and battery life is very acceptable.

Biggest drawback to this rig is the miniscule speaker. I frequently use an earplug, even inside a vehicle. Maybe someone would be interested in working up an audio-boost mod! :-)

Hope this helps. 73s!

FT470: better usage of the computer.
-    uhf rec coverage doesn't seem easily expandable
*   memories can be programmed with separate tx & rx freqs which supports any odd-ball offset you may run into.
*   recalled memory can be tuned without having to switch back to vfo mode
*   pl decode freqs can be tuned thru while receiving, if you are nosey
*   true dual receive, tho I usually leave it off.

* lighted keypad (I miss this on the IC-24)

IC-24AT: can't do the 4 * above

- boneheaded programmer of computer made the tx offset step 25khz, instead of a more usable 5khz
- viewing angle of lcd display is narrow
- small, recessed keypad harder to use, especially if you have big fingers, and also if it's in the dark.

* more ruggedly built (my impression..)
* very wide expaned rec range (varies with each radio, however)
  I get <2uV sense 118-135,138-178,335-485,800-960Mhz
* it is cheaper.

My observation is that Yaesu makes much better use of a computer, while skimping on the ruggedness factor, while Icom makes it more drop-proof and hires brain-damaged (or fired Yaesu) programmers.

I bought an FT470 some time ago, I do notice, even after the factory mod, that it is very prone to intermod. But that is a fact of life for any hot, wide coverage receiver in the L.A. basin.
I recently broke down and got the IC-24 thinking I would sell off my FT470 and while I grumble about the shortcomings of both, each has something I like (but not in common), so I'll probably just keep both handy.
I suggest, if you want wide freq coverage and can live with the price and shortfalls, get the Icom....If you want good ham-band functionality and less pocket-picking, get the Yaesu. Or, like I do, ignore any advice and get what you like...

Well, this little rig has certainly caused a stir on the net. I own one, and I love it. It's a great value for the money. It's not that hard to use, and in terms of price vs. features, it's a great radio.

The biggest problem with the thing that you will hear about is intermod. I have had a problem with intermod on every HT I have seen, as well as my Cobra handheld scanner. The problem is a bit worse on the 470. My personal opinion (NOT shared by some others) is that the intermod problem on the FT-470 is not that big a deal, and it certainly is not a reason to avoid buying it.

I bought the AA battery case, which is nice to have when the nicads go south. I also have the cigarette lighter plug attachment ... lots of whirring noise when I use it while driving. Also, the little clip-on lapel mike / PTT switch is really nice when walking or bicycling.

Here are the mods to the 470 that I've seen posted on the net. I do NOT guarantee any of them, nor have I tried all of them:

FT-470 MODS

Here is a reposting of the mod to extend the receive range of the new Yaesu dual band handie to 130 - 180:

1. Turn radio OFF.
2. Hold down both UP and DOWN arrows.
3. Turn radio back ON.

To enable VHF transmit:

1. Open the radio such that the two halves open like a sandwich.
2. Locate the internal lithium battery
3. Locate several solder pads to the left of the lithium battery.
4. Just to the top left of the lithium battery is ONE vertical solder pad. It is almost under the top left edge of the battery.
5. solder a jumper accross this pad.

Notes:

The other solder pads do several things, none of which seemed interesting to me: one set VHF band to 144-146, one replaces 2m band with 1260Mhz (would be nice if there was a 1260 Mhz RF module available...), two others seem to disable the squelches for the separate bands...etc. like I said, not too interesting.

Also note that for some reason the automatic repeater shift (- offset below 147, + above etc...) goes away when you enable VHF xmit using this mod. I guess you can't have your cake and eat it to. Oh well...

TO ENABLE EXTENDED VHF/UHF TRANSMIT AND RECEIVE:

Hello FT470 owners... I asked a few weeks ago about mods for the FT470 to make it receive and transmit on additional frequencies. I own(ed) the European version which caters for 144-146 & 430-440. It now transmits and receives 140-174 & 430-440, with additional receive coverage 440-500 MHz! The mod was fiddly as the chip resistors are the size of a pin head. You'll need a fine tipped soldering iron and about 2 hours of patience. Here's how I did it...

```
For 2 metres..  locate R66-69...      R69
which are located at 10 O'clock       |
to the lithium battery.           R68-(lithium
R69 is vertical, R66-68 are       R67-(battery
horizontal.                       R66-(cell
```

The combination you want is: R66 & R68 = 0; R67 & R69 = 1.

Mine came with R66 & R69 set for Europe so I just moved the resistor from position R66 to position R67.

For UHF, locate R70-72 to the top left of the ribbon cable. These are vertical and in the order:

```
     R71 R70 R72
```

The combination you want is: R71 & R70 & R72 = 0.

Mine came with R71 set for Europe so I just took the resistor out and have stuck it to the back of the battery (in case I need to convert back).

If anyone disagrees with these mods and think I've done something wrong, let me know a.s.a.p.

Cheers & 73
de Peter G6ZYT.

I'm not sure if y'all have had the chance to see it, but the new CQ
publication "Communications Quarterly" is pretty neat.  It's expensive
(the cover price is nearly $10/issue), but it is to come out every
three months, and it is jam-packed with technical information.  At
least in the first issue, no fluff about contests, DX'ing, etc. and
a distinct lack of the "Build-your-own-whiz-bang-qrp-hf-rig" article
that appears every 2-3 months is all the other semi-tech rags.

Just thought I'd mention it.  For everybody who always claimed "there's
no good technical magazine any more!"  now there is one, though it's
a tad on the expensive side.  From the first issue, it looks worth it.

Greetings.

I have been told by KC3UY and one other person that the widely-published
instruction set for the TS-440S contains an error: it says that you can
flick the 10Hz display on by snipping diode D-60. I have learned that
the diode is actually D-66, snipping D-60 will only frustrate the
operator as he will have to re-solder it back and cut another one.

Can someone verify this information and notify the simtel20 gatekeeper
of the appropriate change?

Also, thanks to everyone who responded about the ts-440s command set.
I sent replies to everyone (including "metoo's"), but much got bounced,
so I didn't ignore you if you didn't get a msg - try again.

A friend of mine, Steve Moore, W0SM, (some of you may recognized the name and call as the of the official 'keeper of the list of HP hams') recently picked up a Collins S line at a local hamfest. The seller didn't have the S line console though, and Steve is looking for one.

If you know of someone who has one for sale or if you come across one at a hamfest somewhere, give that person Steve's name, call sign, phone number, etc. I know he'd be interested to hear. You can reach Steve at T-649-5556, or as W0SM@W0LFJ.#NECO.CO.USA.NA on packet, or on HPDESK as Steve MOORE / HP2411.

Thanks,

Bill Flynn, AI0C

-- MAJOR SOLAR FLARE ALERT --

FEBRUARY 25, 1991

Flare Event Summary
Potential Impact Forecast
SATELLITE PROTON EVENT OCCURRED

MAJOR ENERGETIC EVENT SUMMARY

A major proton flare exploded off the southwest limb today. The event began at 08:06 UT, peaked at 08:19 UT and ended at 09:51 UT on 25 February. The flare was rated a class X1.2/2N Tenflare and was associated with strong Type II, III and IV sweeps. Rich radio emissions were observed from this flare. Solar protons arrived and produced a satellite proton event at 12:10 UT on 25 February. The event was short-lived, however, and officially ended a little over an hour later at 13:35 UT on 25 February.

This major X class flare was spawned by Region 6497 which is now crossing behind the western limb. The largest regions on the disk (6509 and 6508) are relatively dormant, despite their Beta-Gamma magnetic configuration.

POTENTIAL TERRESTRIAL IMPACT FORECAST

This flare was a major event and did produce a coronal mass ejection, as is evident by the strong Type II and IV sweeps which were observed. However, this flare was near the western limb and therefore probably will not produce anything too significant in the way of terrestrial impacts. There is some uncertainty regarding this, however, as events which occur near the vernal equinox can become amplified more than expected.

Preliminary analysis suggests that there is a moderate possibility that planetary geomagnetic activity could increase to near minor storm levels on 28 February. An increase in activity is likely, but the amount of coupling which takes place is uncertain.

Geomagnetic activity is expected to increase on 28 February to planetary A-index values between 20 and 35 for middle latitudes. A lesser impact over lower latitudes will likely be observed. High latitudes will suffer the worst conditions, with low to moderate intensity minor storming occurring on 28 February (A-index values between 25 and 38). Middle latitude K-indices could range from 3 to 5 on 28 February. High latitude K-indices could range from 4 to 7. Magnetic fluctuations between 400 and 750 gamma could be observed over high latitudes, while middle and low latitudes will likely witness magnetic fluctuations between 55 and 140 gamma.

Auroral activity will be most intense over the high latitudes and extreme northern middle latitudes. There is a very slight chance that the impact from this flare could be higher than expected, perhaps with brief periods of major storming over middle latitudes. Please note that this is not very likely, but is slightly possible. If impacts are greater than expected, auroral activity could become visible over the northern latitudes north of about 42-44 North latitude.

HF propagation should remain above normal until sometime on 28 February when the interplanetary shock is expected to arrive. An SSC should be observed with the passage of this shock, sometime on 28 February. Thereafter, MUF's should drop combined with increased fading and absorption (particularly over the middle to high latitudes). High latitude propagation has become degraded due to a polar cap disturbance which commenced on 24 February and remains in progress. Things could get significantly worse over the higher latitudes on 28 February if we are in fact affected by this flare. Polar propagation paths will suffer strong absorption and strong flutter and fading if terrestrial impacts materialize.

There is a chance for VHF auroral backscatter conditions to materialize over the middle and high latitudes on 28 February, particularly during the late afternoon hours and again near midnight. However, signal qualities will likely become degraded for most VHF DX signals over the middle and high latitudes.

A recovery is expected on 01/02 March to generally unsettled conditions. We are nearing the vernal equinox now, so geomagnetic activity should become a bit more active soon. A potential geomagnetic storm warning may be issued within the next 24 hours.

There is a slight risk for another major flare from Region 6497. This risk may exist for the next 24 hours (until 27 February). No major flares from the larger regions on the disk are currently anticipated. Low-level M-class flaring could occur from Region 6504, 6508 or 6509.

CW MEMORY KEYER

During the past couple of weeks I've gotten a few more surprises from this great rig. The biggest single surprise is that each and every unit comes with a MEMORY CW keyer built in! Contrary to the manual (which is the bad news...), which states unequivocaly that the DVR (Digital Voice Recorder) is needed to give the keyer memory. The manual is simply incorrect out-of-hand on this matter.

I didn't notice that the memory keyer function existed until a friend of mine, AA7GU told me about it. I had still been using my external keyer which had it's own memory. I hadn't noticed the feature because 1) the manual said that it wasn't there, and 2) because the 850's CW memory keyer function only works with the internal keyer.

So there you have it - a memory keyer with three separate memories which can store modestly sized CW phrases like CQ's and other standard stuff. And it works exactly like it states in the manual, except that the manual says that it only works when the DVR option is added.

MEMORY CHANNEL SELECTION

A real oddity with the radio is that you cannot place the radio in memory mode and then use the 10 key pad to select a desired memory channel number. To select any memory channel, you have to turn the memory channel scroll knob. On the other hand, when you are storing VFO data into memory, you can use the 10 key pad to specify a channel number. The reason that it's odd is that the TS440 was able to directly select a memory channel by number and so we're all stumped as to how this one got left out in this rig.

THE MANUAL

Overall, I'd have to rate the manual a 5 on a 1 to 10 scale. I would have expected much better from Kenwood on this one. The problem is that the original documentation was written in Japaneese and the English version was written by a native Japaneese interpreter. The translations are "hard" and you can almost hear a Japaneese accent when you're reading it. It would have been soooo easy for them to hire a native English speaking person (preferably a ham) to do the final editing. I would have gladly done it for them myself, in exchange for a demo unit :-).

The manual contains awkward phrases like "Grounding this pin allows transmission". In this case the sentence means: "Grounding this pin keys the transmitter". There is a subtle difference in the two statements that a non-native English translator could (and did) fail to recognize. In the end, the native English user can be easily confused by ambiguities in the manual's wording.

FSK OPERATION

Several people, including myself, have run into a case where a lot of distortion is produced when the radio is fed audio from a TNC. At first, I thought that the audio level was just too high and so I installed a pot in the TNC to correct it. What turned out to be the case, however, was a ground loop condition between my TNC and the 850. From looking at the schematic, it appears that the ground for the audio input on the data connector must be hooked up to a specific pin, even though there are about 4 different pins labeled GND in the manual. One of these pins is specifically for the audio input and it seems to follow a strange and circuitous route inside the transceiver. In the end, my problem was finally solved by making sure that the frame ground of the TNC was strapped to station ground at the back of the transceiver.

I also found that my TNC, an MFJ-1278, already had a TTL level FSK OUT pin available on its rear panel. I've also discovered that the 850 is perfectly happy with the TTL level signal and now I've abandoned AFSK altogether. The direct FSK works flawlessly in all modes and the amount of carrier shift is easily set using one of the setup menu subfunctions.

In my last article on the 850 I mentioned that the passband was not centered over the signal when one was attempting to receive RTTY with the rig set to LSB and the 500 Hz filters were engaged. After doing some reading I've learned that the centering realized in the FSK mode had to do with the relationship of the BFO frequency and the passband, and not to the passband's itself as I may have led some to believe.

This shifting (offsetting) of the BFO occurs automatically when the FSK mode is selected. The setup menu allows you to specify this shift as either 1225? or 2125? Hz to allow for two types of shifts. Neither one of these helps you receive FSK in LSB since 1225 is still way outside the passband of a 500 Hz filter.

In the end, I'm very glad that I went ahead and hooked up to the direct FSK input - it's very clean and the recieve as well as transmit is completely reliable and hassle free.

BITS AND PIECES

There's still no DSP option (as shown in the magazine ad's) available. They are mysteriously lagging in the supply pipeline. I'm aware of none that have been shipped to anyone. I'm really curious as to what, if any difference it could possibly make.

There is still no brochure available (I collect brochures). The salesman at HRO said that Kenwood would only be wasting money to print one right now, because they are already selling as fast as they hit the shelves.

The service manual, rumored to cost $50, is not yet available. Judging by the latest manuals for the 950 and the 140, it will be a very sizable document containing lots of information, drawings and lists.

Looking at the schematics, it appears that there may be upwards of 64 kBytes of firmware in this machine... Boy, I'd love to see the source... :-) Love to hack it too :-)

SUMMARY

Well, there a few minor gotcha's to this radio but then there has never been a rig that didn't have it's fair share of them. Overall, I'd have to say that the bad points greatly outweigh the good ones by an overwhelming margin. I would certainly buy the rig again without hesitation based on what I know now.

I have a Commodore C-64 which is not being used currently (the PC clone is used by my son and wife) which I would like to use for getting into RTTY. I would appreciate any pointers to software and/or hardware, preferrably (sp) shareware/freeware, ftp access or other that might help. Please email as I don't think C-64 RTTY stuff will have that great an interest level.

On January 8, 1991 we were visited by UG6GAT (Karen) and his friend
Armen (SWL). Karen is a DXer and chief operator of Radio Club Station
UG7GWO (no, not UG7GWB).
#
The following interview was made with UG6GAT, DL7MAE, DL1VJ, Karen
and me that evening. I hope you find it interesting.

Q. UG7GWO is a radio club station in Yerevan?

A. Yes, UG7GWO is a collective station of a school, named after Admiral Isakov. For 20m we have a 4-el Yagi, 160m and 80m we use a Delta Loop antenna, 40m we have a ground pland, 15 also and 10 also ground plane. There is no way to buy aluminum tubing in the USSR. You can get it only through some connections, let's say you know somebody who is working at an aluminum factory.

Q. How many amateurs are QRV from Armenia?

A. On the paper we have more than 100, but in reality there are only about 10. There are some very active stations in Leninakan, like the radio club UG7GWB, who is very active in the contests, but unfortunately during the earthquake in December 1988 everything was destroyed there.

Q. Do you think UG is the rarest of the Soviet Republics?

A. I don't think so, there are few hams but they are quite active. I think the rarest is UH, Turkoman Republic. But there is at least one who is very active, UH8EA.

Q. Can you explain the licence system in the USSR?

A. We have four categories, the highest, the first category, can work all amateur bands and modes and the power limit is 200 Watts on the HF bands including WARC bands, and 10 Watts on 160m and VHF.

Second category amateurs are limited to 50 Watts, and may use all bands except WARC-bands and 20m Phone. They can also work VHF with 5 Watts output.

Third category stations may work on 80m, 15m CW and 10m CW and SSB with 10 Watts. They can also work VHF 5 Watts.

Fourth category stations can work on 160m only with 5 Watts. This is kind of a Novice license, there is no code requirement. Also amateurs under 16 years can only get a forth category license.

There is kind of a fifth class of hams, those operating from club stations. These people need to have an SWL number only. Before you can pass a license examination you have to prove that you have been actively listening to the bands by submitting SWL cards from a number of stations.

Q. Is there a way to distinguish license categories from callsigns?

A. Before some years, fourth category calls had the prefix 'EZ' and third category calls all started with 'R'. But now this has changed and you cannot tell the license class from the callsign.

Q. What is the biggest difference between German and Soviet amateurs or amateurs in your country?

A. I think there is not too much difference, only one point: You have better equipment and all the equipment is commercial. Most equipment in the Soviet Union is home brew. But I have to say that in some cases the home brew equipment works better than the brand equipment. I have a TS-520 and a home made transceiver - the home-made is better, but it is much bigger and heavier.

Q. What is the most difficult propagation path from UG6?

A. Probably the Caribbean is the most difficult part of the world for us. You can hardly predict band openings to that area. Whenever the guys in the states tell us that there are many Caribbean stations around, I hear nothing. It is a matter of propagation. Usually the Carribean comes up one hour before the states come through.

Q. You are also chasing DX, you got about 300 DXCC countries. What are the big problems for Soviet DXers?

A. The problem is - just like everywhere - to have good antennas and good equipment. Regarding IRCs, we in UG-land have a little advantage over the majority of other Soviet DXers. There are a lot of stations who send cards direct to me and they put IRCs in the envelope. This is true for all the 'rare' or 'semi-rare' USSR republics, but getting IRCs is a major problem for the UA3s and UB5s. From time to time we will give them some IRCs, as a present, but it is very hard for them. I think some time in the futue, the IRC problem will be solved when Soviet Post Offices start selling IRCs too.

Q. Some DX stations complain about never receiving QSLs from some of the rare USSR republics. Can you tell us something about the problems which exist there?

A. The QSL cards via the bureau take a very long time. At the moment, as Armenia is suffering from a blockade, all direct mail is being delayed of course.

Q. Some time ago, there was a rumor that sending QSL cards by mail inside the USSR is free. Is that true?

A. Well, only if you send the cards via the bureau, it is free. But if you send the card through the mail it costs 6 Kopeks, the same price as for a letter. There are local QSL bureaus in each Oblast. UG has its own QSL bureau and if I send my card through the UG-QSL bureau it is free of charge. The Central Radio Club (better known as "P.O.Box 88") handles only cards for outside the USSR. The local QSL bureaus work rather fast, not so the P.O.Box 88. Everybody from outside the USSR says that QSL cards via the buerau take a long time, something like one year.

Q. Is it a problem for Soviet amateurs to get QSL cards printed?

A. Well, you will not find a printig office everywhere which will print your cards. Of course, the Radio Club helps us to get QSL cards, but these are not of the nicest kind. This is why so many cards from the USSR look the same, like the well-known '40-years-victory' QSL. If you want cards with a personal note, you have to find your own way. Those who have their own QSL cards are very lucky and have good connections.

Q. Do you think it would be better for foreign bureaus to send cards not via the P.O.Box 88 but rather to the local QSL bureaus?

A. Yes, I think it would be better and much faster. The Central QSL buerau needs a long time to proceed the QSL cards. It would be a good idea for big Clubs like ARRL and DARC to go via the local bureaus, not via P.O.Box 88.

Q. Is it true that there will be a USSR Callbook?

A. In 1990 a Soviet Callbook was printed, but not all stations are included because the information came a little late to some parts of the USSR and many people missed the deadline. I think it is available to foreigners also, but if I am not mistaken, there are two different USSR-callbooks, one from Byelorussia the other from Krasnodar (UA6A).

I have always marveled at the curious penchant liberals have for instantly leaping to the defence of their own society's detractors. I suspect it is a form of intellectual Stockholm syndrome.

*** THE SEARCH FOR A STANDARD POWER CONNECTOR ***

The American Radio Relay League recommended the Anderson Powerpole Connectors as League standard for 12 volt power connections. Refer page 60, QST magazine, May 1984 issue for a record of the Director's proceedings.

As of this date, 1/17/89, the following clubs and agencies use these connectors:

American Red Cross, Sacramento Chapter.
Kaiser Hospital, Sacramento, South.
SACPAC (Sacramento Packet Radio Assn).
Sacramento Amateur Radio Club.
Sacramento City Communications Reserve, City RACES/County ARES.
Sacramento Medical Foundation, Blood Bank.
State OES RACES, State of California,
State of California, CalTrans Amateur Radio System (CARS).
State of California, (CALTRANS) Headquarters Equipment Shops.
State of California, (CALTRANS) Transportation Lab.
State of California, Governers Office of Emergency Services (OES) HQ. Sacramento, Ca.
State of California, Health and Welfare Agency, Amateur Radio Station (CARES/SHARES).
Turlock Amateur Radio Club, Turlock, California.
Volunteers in Prevention (VIP), State of California, Division of Forestry, Nevada/Yuba Counties.
Yuba/Sutter Amateur Radio Club.
Yuba/Sutter County Disaster Service Workers.

Not all members have converted over yet. Other clubs have been exposed to the connectors but their status in not known at this time.

Sources of these connectors are:

Anderson Powerpole - Anderson Power Products
145 Newton St. Boston, Ma. 02135
(617) 787-5880
SPC Technology A Mode Connectors - Newark Electronics
Catalog #108, Page 599

The connectors cannot be installed wrong. They are neither male nor female. As the California State OES says "They are sexless". The only mistake that could be made is to get the RED (positive) and BLACK (negative) plastic pieces mixed up, thus reversing polarity.

The 15/30 amp size is commonly used. The plastic parts are the same for 15/30 amp. The silver plated contacts are different only in the barrel the wire goes in. It is smaller on the 15 amp but the contact area is the same as the 30 amp. The connectors dovetail together for a compact unit and can be panel mounted with two aluminum plates available from the supplier.

The suggested configuration is:
Looking at the connection end (opposite of wire end) with HOOD on top, TONGUE on bottom, the RED connector should be on the LEFT, and BLACK connector on the RIGHT. A round toothpick or a steel roll pin, 3/32 inch by 3/8 inch, can be used to lock the two pieces together, and they can be easily separated if needed.

Another nice feature is that when they are disconnected there are no metal parts exposed to short out. The metal contact can be removed from the plastic case using the tip of a thin knife blade. Depress the locking spring located in the lower front of the plastic piece by sliding the metal contact to one side with the blade and pressing down down on the spring while pulling on the wire.

There is one problem that may arise, especially if using a crimper, the contact area of the terminal may get bent down thus causing a loose connection when connected with the other connector. The remedy is simple. Just bend the contact end up slightly, but not enough to make insertion into the plastic piece difficult. There should not be any slack or looseness when the connectors are connected together. A definite click should be heard when inserting the connector in the plastic housing.

The use of these connectors has eliminated the problems of connecting power cables to batteries, and power supplies of different Amateurs equipment. I use these connectors to power my HF and VHF rigs, computers, diskdrives, printers, TV/monitor, scanner, TNC's and etc., etc., etc.

The clubs and agencies listed above have used these connectors during the flood of 1986, the forest fires of 1987 and 1988, and numerous Field Days and DX-peditions.

Les Ballinger, WA6EQQ, State OES Packet Operations Manager,
California Civil Defence Net Manager.

There is a pin on the 567 which should have a capacitor to gnd which
controls the amplitude filter. A .1 or so capacitor from the output
back to this pin will give u some hysteresis and eliminate the
bounce. some experimentation is in order but it's worked for me

I would recommend that you try getting a HT which *DOES NOT* have the ability
to have its receive range opened up. Some of the old thumbwheel-controlled
ICOM radios (IC-2E & 4E) were like this. If you go anywhere near a half-way RF
hostile environment, you will suffer desense & intermodulation with almost
all the modern HT's. This can be bad enough to make the radio unusable.

If you want wideband receive, get a scanner. But beware - most scanners seem lousy in a typical urban RF environment too. (wonder which of the scanner manufacturers will be the first to rediscover the 7360 beam deflection mixer?) And be prepared to throw away the rubber-covered-dummy-load supplied with most HT's as an 'antenna'. Try a 1/4-wave whip or something like the AEA half-wave instead. 5 watts to a 'rubber duck' is less efficient than 1 watt and AEA 1/2-wave so for a given coverage you get longer battery life.

Subject: GPS accuracy in wake of Desert Storm?
To: info-hams@ucsd.edu

The Trimble Navigation portable GPS receiver, a handheld device intended for small boat navigation and available in boat shops, is being used by U.S. troops. Trimble is manufacturing them as fast as possible, but can't keep up with the sudden demand. They're made in here in Silicon Valley. The militarized portable GPS receivers aren't available in quantity yet, so this commercial unit is being pressed into service.

It's a cute little device. It takes about 30 seconds for it to get a fix, it runs on batteries, and it's watertight. (It even floats.) Trimble doesn't promise accuracy better than a few hundred meters, though, so signal degradation for security reasons probably isn't an issue.

John Nagle

> repeater, every amateur could have his own frequency.

The superregen's HEYDAY was the 1930s. It was the receiver of LAST RESORT starting immediately after WW II. The superregen is broad as a barn door (>100 kHz) and radiates trash badly. If you add an RF amplifier to reduce the radiation, the thing is as complex as an xtal-controlled converter running into an AM BC receiver. You can just wrap a few turns around the AM receiver's loop ant. to couple the converter into it.
Car radios are really excellent things to use for AM: well-shielded, real coax input, etc. Digitally-tuned ones would be a real pain - only 10 kHz steps

[More left out]

> With all this novice/no-code tech homebrew chatter, how about an
> updated version of the Benton Harbour Lunchbox (both the "Twoer" and
> "Sixer"). Not much simpler or cheaper than that for a homebrew
> project.

Nor much worse, I might add. While W3TFA nearly has WAS using a Sixer as the transmitter, he uses a converter into a REAL receiver, and keys the Sixer on (gasp) CW. Straight AM, with carrier and both sidebands, using low power, is at a terrible disadvantage in covering distance. Hardly better than the equivalently narrow FM used by hams.

Say, maybe there IS a market for a no-frills SSB rig design/kit for 6 meters. With the $65 availability of the milliwatts-to-10 W "brick" amplifier used in many of the Far-Eastern rigs, moderate power output should be a snap.

****
As a "market survey" please rate the importance on a scale
of 0 (NOT important) to 10 (VITAL):
50 MHz SSB TRANSCEIVER INTEREST SURVEY
Cheap ____ Very simple ____ Design _____ Kit _____
Small _____ Hand-held ____ Mobile in car ____
Age of respondent: Under-30 ______ 30 or older _____

Maybe. But since the lives of lots of nice, young people are involved, why take
a chance? Is showing off our 'smarts' here really that important?

I'd like to throw in a comment on this. As I was starting, I could COPY

5 wpm fairly easily, but I could not send with any degree of proficiency. I had about given up on Morse code.....then I figured I may as well try an iambic keyer (couldn't hurt!). Within 30 minutes I was able to manage the iambic keyer....AT ABOUT 7 WPM.

I use an iambic keyer. I can't use a straight key.

MY ADVISE is to try both....use the one you can most easily send with.

Diana

About a month ago, a thread here discussed non-acidic RTV... in particular, mention was made that Permatex Ultra Blue brand was available at Ace hardware.

If you drop by your local Ace and don't find it on the rack, don't be discouraged. Ask the salesperson if it can be ordered. It's listed in the Ace catalog that contains automotive supplies and gaskets.

Turn-around time for the order, at least where I went, is supposed to be about four days.

As your leader says, "read my lips: it's public information". Nobody is
endangering anybody by discussing it in public, because it has *already*
been discussed in public.

North Korea is not a DXCC country because there has never been any
legal operation from there. If there were to be a legal operation

(and approved by the DXCC desk), then N. Korea would be added to the DXCC list. There is a DXCC rule to this effect. Even if the guy were actually in North Korea, the QSO doesn't count for DXCC because he's operating illegally.

> 890 US I-A      WLS  Chicago            II-A  KDXU St George, UT 10kW
```

The infinite wisdom of the FCC is underwhelming. Here on the west coast (on the "far edge of the country", at least the lower 48), the three Chicago stations were definitely copiable before the II-A's were added. I can sometimes copy WLS thru KDXU even now when the ionosphere cooperates. When I lived in Seattle, (on the far edge), I could copy WCBS (this was before KRVN).

I have a question about WCCO. There is a 5 KW station in the California mountains east of here that is also on 830 kHz. and wipes out WCCO much of the time. Is this an unlisted class II-A, or does it operate under some other loophole? It is clearly nonsense to say WCCO could never be heard on the west coast. Furthermore, KFI in Los Angeles can be heard in Minneapolis (I used to live there).

A similar situation exists with KOMA (1520) (I-B) which has interference from a 5KW station in Salinas. Luckily, I can null that one as it is 90 degrees away from Oklahoma.

Ban all books. Ban all TV. The police will be around to collect your radios tonight. All newspapers are to stop printing immediately. Everyone is to stay at home and contemplate their navel. No thinking allowed. Anyone found with a pen or pencil will be shot, no questions. Journalists will be shot as they can't be rehabilitated.

Yeah, I guess those abstract constitutional rights that Jim wants us to give up are not so important. I guess that nobody saw all this dangerous information when it appeared in print the first time. Didn't Saddam say in one interview how much information he got from USEnet?

I don't remember seeing the posting -- what was Saddam's opinion on code/no-code? And does HE give his name when he goes to Radio Shack?

Lighten up, Jim. If it ain't classified, the Iraqi's know it. And it isn't a crusade.

rkarlqu@hpscdc.scd.hp.com (Richard Karlquist N6RK) says:

>North Korea is not a DXCC country because there has never been any
>legal operation from there. If there were to be a legal operation
>(and approved by the DXCC desk), then N. Korea would be added to
>the DXCC list. There is a DXCC rule to this effect. Even if the
>guy were actually in North Korea, the QSO doesn't count for DXCC
>because he's [sic] operating illegally.

(with a call like P5YL you might suspect a Slimess!)

I wouldn't waste the electricity calling P5YL. There is a JA who is known for getting on the air with calls like this - earlier it was P5DX, on 15 cw, and he's been XZ-something as well. It's hard to distinguish between Korea and Japan from here, but the JAs can tell where the op is, and it ain't N. Korea.   When he (?) was on as P5DX, the QSL route was given as "via TDXB", which is "The DX Bulletin" - ironically, the latest issue of The DX Magazine (run by the same person) has an article about an application for new country status for P5 (N. Korea). I don't think the editor is crazy enough to encourage pirate operation as P5 to bolster the case for separate country status.   The article was sort of asking for assurance that N. Korea would count as a separate country, since some USSR hams might try to operate from there, but wouldn't bother if it just counted the same as S. Korea.

The last time P5-something was heard, he (?) changed to a different call on teh same frequency at the same sending speed, a few minutes after closing down as P5-whatever.

OK, there could be a real P5 operating illegally, but the word is that all P5s heard recently are the work or one person who is not in Korea.

Good DX to ya!

I would be fascinated to know how information that has been published in everything from IEEE Spectrum to Sailing magazine could "endanger lives"?

BTW those "abstract constitutional principles" have been responsible for a lot more good men dying than the entire allied casualties so far in this war! Maybe YOU don't think the U.S. Constitiution is anything more than a some abstract ideal, but some of us disagree.

I would also draw your attention to the fact that Henry Spencer is in Canada which last time I checked was an independant country.

If guns are banned how will Conservatives win arguments?

QST to all Legal counsel and interested lay-hams.

The latest move that the city is attempting in their quest is to shop for an appraiser to claim that the antenna will impact the property values.

> I received a call, without warning at 8:00 p.m. Saturday evening.
>
> The appraiser's first comment was "I have ten pages in front of me, what does it look like and how high is it."
>
> They didn't give him the drawing of the 4.5" dia. telescoping mast or the antenna drawing or the list towers and tribanders that are already up in Rocky River, OH 44116.

```
Now for the question;  Do you think that they need a FULL
                       appraisal(must inspect house for number
                       of rooms, decor, condition, floor plan)
                       to determine the impact of an antenna
                       on it's value?

                       Is it harassment to send not one but
                       THREE people into my house to snoop?

Sure it has... Well, at least in Aviation Week. The US Govt has been advertising GPS as good for civil use, then reserving the right to degrade the signal. The recommended way (as seen by civil airlines) to improve accuracy is to use GLONASS, the Russian system, which the Russians promised not to degrade. [let's see how effective Mr. Grubs' rantings are at keeping GLONASS secret from the Iraqis...]

Sure it has. Maybe not in sailing, but in the IEEE journals and Aviation Week. There are plenty of potential Navstar users, notably the aviation people, who badly need high accuracy and don't like DoD being able to degrade their navigation aids without warning. Those people have been very interested in ways around the problem, and much has been published on the subject.

Satellite Keplerian Elements Available for Anonymous FTP

For those that are having difficulty receiving the NASA satellite tracking element sets via News postings, I have set up and maintain an archive of these element sets accessable by anonymous FTP.

The server is:

nachos.ssesco.com [192.55.187.18]

T.S. Kelso's element sets (the most current and several previous versions) are maintained in the directory:

sat_elements/nasa

New element sets are posted weekly.

You can also find the Molczan element sets on the same server in the directory:

sat_elements/molczan

These are also updated weekly.

When logging-in to nachos, please use your e-mail address as the anonymous password so that we can trace network problems if they should occur.

Thanks go to T.S. Kelso and Mike McCants for providing these element sets on a regular basis.

Address problems with the server to: elmquist@ssesco.com

>That hasn't been discussed in IEEE journals and Sailing, has it?

Interestingly enough it HAS been!

(I pick my examples carefully you know - GOTCHA! :-))

IEEE Spectrum about 18 months ago
featured a debate about the wisdom of ncrypting parts of the
information. THey drew analogies to WW II navigation aids which were
generally left in place because their removal caused more problems to
our side than aid to the enemy (we used them a LOT more :-))

THey also described several techniques for defeating the encryption
indirectly. (I.e. not by breaking the code).

THe closing comment was an about a reporter who asked a Soviet Military
Attache about the possibillity of their using GPS to target missiles.
The response was essentially "You must be joking. THats the dumbest
thing we could ever do!".

All with far more circulation than Usenet!

Sailing magazine had a writeup on some methods to use GPS in a harbour
provided you has a reference point. THe "fuzzing" only destroys ABSOLUTE
accuracy, not relative accuracy according to their article.

CMD(B/H/J/K/KM/L/M/R/S/SR/V/?)>
```

U2MIR-5 was active last week when U2MIR-1 was issuing "busy" signals.

* MAGELLAN NEWS *

The Magellan spacecraft has now completed over 944 mapping orbits covering almost 50 percent of the surface of planet Venus. All systems on board the spacecraft are performing well.

* SHUTTLE INFO *

Shuttle Communications Frequencies (UHF-AM)

243.000 MHz	Standard military aircraft emergecy frequency
259.700 MHz	Air-to-ground or suit-to-orbiter
279.000 MHz	Suit-to-orbiter or suit-to-suit
296.000 MHz	Primary UHF downlink
296.800 MHz	Air-to-ground or orbiter-to-suit

The UHF communications system is primarily designed to support duplex voice communications between EVA crew members and the orbiter. Two UHF antennas are used in this system. The primary UHF antenna is an annular slot antenna. The second antenna is a microstrip antenna having a gain of -10dBci, and is primarily used by astronauts in the airlock.

Simplex mode:

The on-board voice signal from the audio system is first clipped to an RMS-to-peak ratio of 0.427 (9.0 dB clipping) and filtered (300-3000 Hz) before amplitude modulating the carrier with a modulation index of 90%. Transmitter power is 10 watts.

EVA Mode:

The UHF communications system can support two astronauts performing EVA for two-way duplex voice transmissions and reception of EKG signals. In the primary mode, the orbiter UHF communications system transmits a 298.600 MHz carrier which is amplitude modulated by the voice signal. It simultaneously receives the 259.700 MHz and 279.000 MHz AM carriers from two astronauts. Each received Am carrier includes a voice channel and a frequency modulated EKG subcarrier channel. Transmitter power is lowered to 250 mW in EVA mode by bypassing the final power amplifier.

S-Band Microwave Frequencies (Wideband FM)

Air-to-Ground : 2205.0, 2217.5, 2250.0, 2287.5 MHz
Ground-to-Air : 2041.9, 2201.4 MHz

2287.5 MHz	Primary digital downlink
2250.0 MHz	Main engine analog telemetry during launch

The voice downlinks employ digital slope delta modulation and are multiplexed with orbiter telemetry. Downlink TV is wideband FM.

Hi. Just a quick note that I am looking for a good job in the digital TV area.
Find my resume in   misc.jobs.resumes

I got caught in Philips' reduction in force. Philips is in bad fincinal shape.

Anyway, call me at 201-261-4066. Point any and all headhunters my way.
don't try to e-mail, as my account may be deleted soon. Suprised that it still exists.

Thanks

I hate to do this ... but I recently started digging into the TS-440S computer interface again, and I LOST THE LIST OF COMMAND CODES that get sent to and from the tranciever, to make it talk to the computer. Would somebody please e-mail it to me. (I'll accept "metoo's" and re-send).

Looking further, I found that the IC kit that Kenwood sells for abt. $60.00 consists of an 8251 and a 4000 series CMOS part -- a total whopping $3.00 in parts. The IF-232 line level interface, I imagine, is a max232, which is a $5.00 part and would be trivial to fabricate. I'm curious, though, if anybody knows any details on this IF-232, like where it gets its power from (is it on the connector on the back of the rig?). The IF-232 is around $100, but you could (again) build one for a few dollars (less than ten including connectors) in parts.

Thanks in advance to anybody who can mail the 440 command set to me, or
at least point out where I can ftp it from.

Chris/WZ2B

****info alert****
This is not true! An antenna will radiate best at a frequency at which it is naturally resonant (468/f[in Mhz]). If fact it often acts like a filter, both on tx and rx. For example a very long antenna may not be able to capture a signal if the signal induces an equal positive and negative voltage in the antenna. Wire antennas work great but you may want to decide which bands you want to operate on and have several wires. Usuially a wire that is an odd number of wavelengths long works pretty well with out too many funny lobes in the pattern.

>the antenna away from "lossy" things like trees as much as possible.

A good idea. The ends of the wire can be near trees but the high current portion of the antenna should be in "free air." Most of the radiation of the antenna is from the high current point. In resonant cases the high current point and the high voltage point will be the same. To figure out where the high current point is, start at the end of the wire and measure in 1/4 wavelength. This is your (first) high current point. On a Dipole this is the center. If you are using a frequency with a wavelength that is shorter than your antenna the next high current point will be 1/2 wavelength away from the first. Notice that even though it will be "negative" when the first point is "positive" that energy will be radiated due to the velocity factor of the wire. This often results in the strange lobes I mentioned earlier, but I won't go into that here.

Just to clarify, a technician can use satellite communication, and can
even be a control operator of a space station (satellite) or earth station
(ground station used for satellite communication).  A space station can
only be licensed to an Extra class operator but any class licensee can be
designated the control operator of a space station (97.207a).

I'm interested in building a RTTY/FAX decoder from the ground up (less the receiver). What I need is a good reference book on the various formats currently being used. Nitty-gritty details such as common frequency shifts, speeds, timing and sync information, etc. Any ideas?

The FT73R requires an FTS12 option board for use with subaudio tone squelch. I've been given the superficially similar FTS16 board, but the FT73 seems not to recognise that the option is fitted.

Does anybody know what the difference is between the FTS12 and the FTS16 ? I've tried resetting the FT73 with no joy - are there any other tricks required to get it to see the option board (yes, I have RTFM!) ?

And then what I really meant to post was:

Hello,

I would have posted but local problems....Diamond, Comet and Larsen, all make 200/70 cm dual banders. If you need a little gain than the Austin provides you might look into one of these. Theyare, however, somewhat longer in length. Diamond (and I think Comet) have various versions some with very high gain (and higher prices of course) Larsen tends to be a bit more expensive for the same amount of gain. If you are into some that looks like a celluar phone antenna, check out Diamond. If you are using OTHER than a 1/4 wave (or multiples thereof) (like the Austin) mounting it in the center of the roof is not as important due to the fact that 5/8 and especially 1/2 wave configurations tend to be somewhat ground plane independent. I say 'somewhat' cause they prefer a ground plane but don't mind one that is not perfectly flat and symetrical...THe shortest length versions are usually resonate as a 1/2 wave on 200cm and 5/8 wave on 70cm...33 in long. They have a 1/4 wave stub in the form of a coil (could be enclosed or open...same thing) in the center. Beyond this there are more ocmplex versions with higher gain. Oh, yea the 1/2 x 5/8 wave runs about 2 db on 200cm and 3 db on 70cm and will out perform any 1/4 wave to a station at the horizon....

What do I use ? I build my own (usually). What would I use ? well, here we have mountains so a very high gain (i.e. low signal pattern on the horizon) doesn't work to well for repeaters within 50 mile range (mountains are over 1 mile ABOVE average terrain). Frequently a repeater site is at a 45 degree angle from a mobile location. Having high gain slams most of the signal into the base of the mountain !! So for me a compromise would be a 1/2 by 5/8 configuration. (I'd go with a Diamond with a NMO mount cause they are less $$ than a Larsen and work as well....)

But if your in a area which is mostly flat (MA ?) then you might want as high as gain as you could get limited only by how long an antenna you could tolerate on the rear fender (?) of your car. The idea is to get the signal pattern as low to the horizon as possible...Oh yea Diamond does have some version with the Larsen "NMO" mount these mounts are OK below 500 Mhz. Beyond that they become lossy...(Larsen has a special version for > 500 Mhz)

There you have it ... If you want me to be more specific (i.e. model numbers) let me know (and sources)

Let me know what you end up with and how you like it ... Antennas are what "turns me on" in Ham radio ....

Have fun ...
Thad   KG5ES

PS Diamond has some good duplexers. They seem to have done a good job on a low loss design...

Sorry, jv...

Well, the new (October 1990) Buckmaster "Ham Call" CD-ROM just arrived, and I'll be integrating it into a packet BBS somehow, but in the meantime, who are the garage-rock bands on tracks 4 and 5, and who is the techno-synth band on track 6? They're pretty good, actually.

Yeah, I stuck it into my audio player. Why not?

Xref: gmdzi rec.ham-radio:20584 rec.radio.amateur.misc:46 misc.wanted:6852

I had a program in my Hamshack arsenal back when I still had my Commodore 64 that was from out of a 73 Magazine (amateur radio magazine). It was in basic, and was essentially written for the Commodore 64 & 128 computers.

I am not sure what issue it was in, and thus I can not find the article. I beleive that I would have been 1989, but could have even been from 1988 to early 1990. The program would ask for the date, and the solar index from off of the WWV forcast, and would then ask for the coordinates to the locale that you wished to call. It would thereafter return a chart of the MUF, and best frequencies for operation for every hour of the day. If anyone knows what issue this was in, and or, can send me a listing of the program, it would be most appreciated. I have checked with the local libraries, but none of them carry 73.

I intend to take this program and convert it over to C. That way (after chasing down the original writer, as well as the 73 staff) I will see if we can get it out in teh public domain, as well as possibly back into the magazine. Please, if you have some old magazines around, help me out.

Thanks.

With all the recent discussion on the merits/demerits of DSP vs CW, maybe i can throw in a historical perspective!
The PICCOLO system was developed in the late 1950's/early 60's by a team led by J.D. Ralphs of the British Diplomaytic Wireless Service (part of the Foreign and Commonwealth Office). The first versions used relatively primitive techniques to give a multiplexed radio-telegraph service, later models (typified by the RACAL LA1117 modem, RACAL Communications Ltd, Bracknell, Berkshire, England) were more advanced and compact.
The 'Piccolo' system uses multi-frequency transmission, that is, a series of tones, transmitted over a HF radio link. I quote:

> 'It has been demonstrated that, with few exceptions, if a signal is at all audible then communication is possible with adequate accuracy for most purposes, and it is a routine occurrence for signals to be successfully worked despite their being totally undetectable by the ear of an experienced Morse operator'.

(I guess this was where the 'CW-vs-machines' argument starts off!)

He then goes on to describe a system covering distances from 1500 to 12000 kilometers using 8-meter endfed whip antennas and transmitters of less than 500 watts. The first of these was used in New Delhi (1962) and 'it cleared in a few hours the backlog of traffic which had accumulated despite the strenuous efforts of the operators of two hand-speed Morse channels operating as near to 24 hours per day as propagation conditions would permit'.

Later he states 'that by 1975 virtually no Morse links were operating within the network'.

Note that this is not DSP! The first versions used tuned circuits and tubes, later versions used germanium transistors. The circuitry involved in modulating/demodulating is essentially all analog.

Anyone interested in further reading should get a copy of the book
'Principles and practice of multi-frequency telegraphy'
by J.D. Ralphs (ISBN 0-86341-022-7) published in 1985 by Peter Peregrinus Ltd, London, as part of the IEE Telecommunications series.

Another useful document on PICCOLO is:
Schemel R.E. 'An assessment of PICCOLO, a 32-tone telegraph system' SHAPE Technical Centre memorandum STC TM-337 (1972) File ref. 9980,
DRIC no. P186242

The Ralphs book has a mathematical treatment of the operating principles; if you are familiar with Bessel-functions you will *LOVE* this!!

Also in the above series of books is one by W.B. Robins wntitled 'Phase noise in signal sources'; having read it, i can only assume that it is not on the bookshelves of the designers of most ham-radio synthesizers!

I think your statement is a bit too strong. At least that's my understanding from what I've read; not being a toxicologist I'm not an expert, so don't sue me.

My impression is that BeO is safe when it's a solid mass, as it is supposed to be in a working tube or transistor. The danger occurs when you do something to it (such as grinding it, or crushing it) that creates dust, and then you ingest/inhale the dust.

I looked in the Wakefield heat sink catalog for info but didn't find it.
Some similar sort of publication would have more detail, though.

The Soviet system is called GLONASS. I don't know what it stands for either, nor do I know how many satellites are in service. I read that some people at a British university have decoded and published the GLONASS data format (sorry, no references). It uses the same microwave bands as GPS, and a single receiver could theoretically use both systems simultaneously. A possible disadvantage is that current-status information may not be available for GLONASS (as it is for GPS via WWV).

Repeatability isn't the same as accuracy. Is Loran-C really ACCURATE to the number you quoted? (The FAA writeup about it says otherwise.)

See February/June/October 1988 issues of Ham Radio Magazine for my series on microwave station design. It details the 10368 MHz transverter but 1296 and 2304 versions come basically for free once you have 10368 built. Since the series I have added 50 MHz through 900 MHz and 1269 MHz (Oscar mode L) local oscillators to complete vhf through microwave coverage (well almost, wb7abp has been trying to get me to complete 24 GHz so I can work him). If you are interested and want more information please let me know.

Last night on 15 CW, I answered a CQ from P5YL. Not being able to find P5 on my DXCC list, I asked "Kim" his QTH. He replied "PYOUNGYANG <garbled>TH KOREA". I thought "Oh, a new prefix for South Korea", and left it at that. Then I looked at a map. Pyoungyang (I may have the spelling wrong) is in NORTH Korea! There was no pile up on this guy. Did I work my first genuine Slim? I looked at the "International Callsign Allocations" in the Callbook, and sure enough, P5 is allocated to the Peoples Republic of Korea (North). I've never heard of any actual ham radio operation from North Korea, not surprisingly, as it's even more of a restricted society than Albania.

Even if it were for real, why is North Korea not a DXCC country? Are there political reasons for this, or is it simply that there never has been any activity from there, and this is a moot point? If we consider the Russian Republics, and Hawaii to be DXCC countries, why not North Korea?

Drake used to before they got out of the ham radio business. Like the TR-7.
Nary a bell nor a whistle, but +20 dBm third-order intercept, low phase
noise (compared with most other synthesized radios), continuous-duty power
amplifier, switchable filters independent of mode, passband tuning, and
provision for use with companion R-7 receiver. It makes me wonder what
their latest radio would be like if they had stayed in the business.

Has anyone heard if Kenwood has plans to replace the 731 mobile with
something new?

I just bought a TH77A handheld and love it. Would like the same
features in a mobile.

Please post any info.

Thanks and 73.

Just a guess, but the Islands On The Air people speak this kind of language. If so, then St. George Island would be island # NA-85 on the IOTA list.

You have just stumbled across a IOTA operation. IOTA is Islands On The Air. It was origianted in England several (Many?) years ago. Many of the Islands of the world are assigned a number and people go there to work others. Like DXCC, there are awards and various levels of achievement. The North American 85 is the designation of St. Georges island. So if you worked him and got the QSL card, you have confirmed one of the islands. Unlike DXCC where there are few, if any, new ones, IOTA abounds with islands that have never been activated before or have been many years since the last operation.

More information can be obtained from DX Bulletin in Fullerton, CA or e-mail me and I will give you more info.

```
*********************************************
***    GEOMAGNETIC STORM WARNING UPDATE   ***
*********************************************
```

02 February, 1991

Informational Update
Solar Activity Forecast

ATTENTION:

An interplanetary shock was observed at 18:42 UT on 01 February in response to the major X-class proton flare of 31 January. This was followed by minor geomagnetic storm periods until about 23:00 UT on 01 February. Activity has since declined to active levels.

Magnetic activity is expected to intensify back to minor storm levels this UT day (02 February). Magnetic A-index values are still expected to reach 45 over the middle latitudes. There are expected to be periods of major geomagnetic storming over middle latitudes.

A low latitude auroral activity warning remains in effect for 02 February, although the potential for observable low-latitude activity has decreased due to the storm detensification which has been observed over the past several hours. Also, lunar interference is expected to significantly hamper attempts to view auroral activity over low and middle latitudes.

A magnetic storm has not yet been officially declared. Activity has not yet attained storm levels for a sufficient duration or intensity to be classified as a true magnetic storm. However, a minor to major geomagnetic storm is still expected. Hence, the geomagnetic storm warning continues to remain in effect. A geomagnetic storm alert may be issued today if storm intensification occurs.

The potential electrical anomaly warning associated with geomagnetically induced currents remains in effect for 02 February, although the probability for magnetic excursions capable of producing influential induced currents has diminished notably. An alert for this phenomena will not likely be issued.

Geomagnetic storming is expected to maintain levels of minor storming through 03 February. A gradual return to normal conditions is expected on 03 and 04 February.

HF radio propagation has experienced degraded radio conditions over the past 12 hours (since the arrival of the shock), however the uncharacteristically low levels of activity which have been observed indicate that radio propagation may not be affected as adversely as originally predicted. Some significant degradation is still expected when (and if) reintensification of the storm occurs. But for the most part, radio propagation should remain generally poor with periods of very poor conditions over all latitudes. High latitudes will remain mostly very poor.

The potential for auroral backscatter communications on VHF bands has diminished somewhat, although there is still a good chance for some backscatter communications during the more intense periods of magnetic and auroral activity.

The risk for major solar flaring remains high. Region 6471 (now near S12W11) is the most capable region for producing high terrestrial impacts. However, this region has been unusually quiet, despite several areas of observed magnetic shear as well as several areas with magnetic delta configurations. This region remains highly complex and contains high magnetic gradients. But it has not produced any noteworthy flaring for several days now. High terrestrial impacts are possible from this region should major flaring occur within the next three days. Thereafter, the potential potency of terrestrial impacts will decrease.

The satellite proton event ended at 15:40 UT on 01 February. The PCA event also ended on 01 February. There is a moderate to high risk for another proton flare from the regions currently visible. The regions nearing the western limb (6462, 6466 and 6469) remain capable of producing another proton event, but the greatest risk at present is Region 6471, which is due to begin spawning major flares anytime now. The recent development of magnetic shear in this region lends further support to the prediction for major flaring from this region. Watch for possible flare and/or magnetic storm alerts.

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion or Ballistic Coefficient (Depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used. Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type
65-68	Element number
69-69	Check Sum (Modulo 10) (Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]
44-51	Mean Anomaly [Degrees]
53-63	Mean Motion [Revs per day]
64-68	Revolution number at epoch [Revs]
69-69	Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

```
NOAA 6
1 11416U          86 50.28438588 0.00000140           67960-4 0  5293
2 11416  98.5105  69.3305 0012788  63.2828 296.9658 14.24899292346978
```

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

Medium Wave (AM broadcast) "clear channel" Class I stations are protected from co-channel and adjacent-channel interference in BOTH their primary [local] coverage area and their night-time skywave coverage area. No other station class has its sky-wave [ionospheric] area protected against interference. Power allowed Class I stations range from 10 to 50 kW (I think all are actually 50 kW). There is only one primary station on Class I-A channel. There are two primary stations on Class I-B channels. Just after WW II, a number of daytime-only stations were also assigned to the clear channels, and some of these have been upgraded to more- or full-time, with resulting increased interference. About 1980 a few Class II-A stations were assigned to I-A channels at the "far edge of the country", where the primary Class I station could never be heard and the new station would never interfere with the primary station.

The clear channels are:

I suggest you get a DOS copy of 'grep', usually a UN*X command, and do a primitive search on all files actually posted to your board. Maybe you could also temporarily store messages passing through and grep them as well before forwarding them. Grep is a file search utility. You could search for certain keywords that are notorious for being inflammatory. Thus you could bounce files back to owners without having to actually READ them.

I realize this doesn't solve the more global problem, but the intent would certainly be recognized if it became necessary to prove yourself in court or in letter to the FCC.

>responsible.

The question is whether this is "policy" or just one guy getting carried away and burning through his whole pad of citation slips.

A check of the rulebook shows that VHF packet forwarding stations are given a specific exemption allowing automatic control, while originating stations are specifically not. That sure makes it sound like sound like forwarding stations don't have to screen all messages.

Absolutely correct.
Texans speak TEXAN
TEXAN is logically
the Universal World
Language.

There was an article in "The DX Magazine" Feb. 1991 which described a proposal for North Korea to become a separate DXCC country. From what the article said, there has been no *legitimate* operation from P5 since WW2. Chances are you worked someone who's really there, but isn't officially licensed. Sort of like XZ9A in the Karen State (Burma) which isn't recognized.

No. Running QRP (low power) as an inexperienced novice is going to be frustrating. You should run about 100 watts or so until you gain operating experience. Get a used rig if money is a problem. Then, by all means, build your own QRP kit.

If used into an antenna on the ranges specified it would indeed be "out-of-band", however on the band it is transverted to, it is within the band.

If you misunderstood Glenn's article, I strongly suggest you may not be qualified to advise novices that they BEGIN with 100 watt transceivers as a stepping stone to QRP operation. [:-)

As for ham slang, why not?

In article <19706@shlump.nac.dec.com> koning@koning.enet.dec.com writes:
>Repeatability isn't the same as accuracy. Is Loran-C really ACCURATE to
>the number you quoted? (The FAA writeup about it says otherwise.)

Not clear. My biggest problem in verifying the figures given by my LORAN receiver is the proliferation of geographic coordinate systems, all subtly different. For example, LORAN places my house about 400 meters east and slightly south of the position given by the USGS 7.5-minute topographic map for Chatham NJ. However, LORAN uses the WGS72 or WGS84 coordinate system (depending on which publication you cite) while the USGS maps use the 1927 North American Datum. Although I don't have any references on how to convert from one system to another, I suspect that much of the discrepancy is due to the differing coordinate systems. (Longitude has always been much harder to measure accurately than latitude). In a few other field tests using FAA-supplied coordinates for airports I've gotten much closer agreement (~40m) to my LORAN readings, although there is still the question of what spot on the airport the listing refers to.

LORAN accuracy also depends a lot on where you are. Each LORAN chain has a set of monitor recievers at well-surveyed locations, and the phasing of the LORAN transmitters is adjusted periodically to keep these receivers "in the right place". The monitor for the Seneca-Nantucket-Carolina Beach triad is in Sandy Hook NJ, not too far from me, so perhaps my results are better than average.

In practice my biggest problems with LORAN have been propagation blockages and interference, especially QRN and shielding from bridges and power lines.

Remember also that most practical applications of navigation require that you be able to record your position and then return to it later. A good example is a fisherman who needs to return to his lobster pots. The absolute accuracy of the system is not as important in this case as its repeatability.

WB0MPQ just gave me a package of literature from Magellan for a neat little GPS OEM kit. For $950 you get a couple of circuit boards and an antenna. Rated accuracy from a single fix is 25 meters in the 2D mode and 30 meters in the 3D mode. They claim this can be improved somewhat with averaging, but there is also a bothersome footnote: "Accuracy subject to change in accordance with DOD civil GPS user policy". Although I suspect that GPS receivers will get even cheaper after the war is over, chances are Selective Availability will be turned back on again - so the party will be over.

What really burns me about this whole selective availability thing is how the DoD sold GPS to Congress by touting the civilian spinoffs.

(GPS is an expensive system even by US military standards.) The big push was in civil aviation ("just think of all the money you could save by shutting down all those VORTACs, NDBs, ILSes and LORAN-C transmitters ..."). Then when they get the satellites up and running they decide to take their marbles and go home.

Fortunately (for us) $47.6M of funding for military GPS receivers was deleted from the FY 1991 budget. The stated reason is that the GPS program is behind schedule so the money isn't needed. One can only hope that the real reason was to force the DoD to be more willing to share its toys...

A good article on the politics of GPS vs LORAN is "Terrestrial Navaids - Critical Stepping Stones to Satellite Navigation" presented by John Beukers at the Wild Goose Association in October 1990.

>
> As I always have been interested in servers, I would like to give it a try.
> But how does one log in after establishing the telnet connection?
> Which is the logon userid and password?

You would issue the following command:

```
telnet marvin.cs.buffalo.edu 2000
                               ^
                               |
                     this field is the socket you wish to connect to
```

Most of the callsign servers (all two or three of them) have been using socket 2000.....hope this helps....

Randall Rhea responds.....
^^^^^^^^^^^^^^^^^^^^^
>No. Running QRP (low power) as an inexperienced novice is going to be
>frustrating. You should run about 100 watts or so until you gain operating
>experience. Get a used rig if money is a problem. Then, by all means,
>build your own QRP kit.

I generally agree with Randall's advice because a new novice has enough of a handicap without being QRP. However under special conditions being a QRP novice is not a problem.

In cases where a group (e.g. Boy Scout or school class etc.) who live close together get their novices together, being QRP is not a problem. In the mid fifties, novices from my high school radio class built their our own 1 tube xtal controlled transmitters (5 watts or less input). Those who stuck it out usually went out and eventually bought commercial rigs but it was nice to be able to get on the air with $15.00.

Anyway, if there were something like a Heathkit or some other low cost rig that works...it may be worth looking into. The Ramsey is not the answer. I bought a 40 meter kit from them about $25.00 plus $13.00 for the case (about $40.00 with shipping etc.) and it didn't work. It's tuning range was somewhere in the 8 MHz range. I had to add some capacitors to bring it down to 40 meters. Can you imagine the frustration a novice would have with this rig. Also the assembly instructions are something like this..."1. install all resistors. 2. install all capacitors" etc. etc.

About three or four months after I bought the receiver I saw an article in

one of the magazines (I think it was QST) on how to make this receiver work.
Why anybody would print an article like that bothers me. Why didn't they just
say don't buy the receiver because it doesn't work!
  Off soap box.

During the Desert Storm U.S. Military Briefing last night in Riyadh a
reporter mentioned a report from a "ham radio operator" saying that renewed
activity was heard around the town of Khafji. The military spokesman said
that there was absolutely no renewed military activity and that there was
no intelligence data to support the ham radio operator's claim. The reporter
didn't mention whether the ham had been in contact with a Saudi ham or not,
but the military spokesman assumed the ham was SWLing on military frequencies.
The spokesman stated something like "if the ham was listening to English,
there's no way he could have deciphered our transmissions....we use VINSEN to
cover our transmissions....."

Support Desert Storm - I second.

Perhaps Jim's just jealous
Last I heard there's a
shortage of Armadillos
in Ohio.

Really they're most loveable
creatures.

Don't leave a New Englander loose
in West Texas without an interpreter!

And for some parts of the east
even an interpreter might not do much good.

> "there's a lot of QRM out there, old man." I don't know if he's saying
> "QRN" or "QRM", so I don't know if we should just change to another
> frequency, or what.
Absolutely! (although sometimes it's a bit more
convenient to say QRM because it's a bit shorter
and in context it should be understood.)
>
> Hams tend to use English in an interesting way. 2m mobile conversations
> often end with "I'm destinated now." The word "destinated" does not
> appear in the dictionary.
Perfectly true, and (maybe because I'm such a
conservative for that reason I won't use it);
but just off the record, the word does seem to
have some merit. It has a reasonable etemology (sp),
clear meaning, and is a bit shorter than "I'm where
I'm going". But I do have an aversion to non-technically=
derived non-dictionary words, too.>
> I'm especially irritated with the term "seventy-threes". This term

>   threes to you, old man.
An interesting exercise is to translate this into some recognized
language. I'll give a try at "My QTH is mobile". How does "I
have no idea where the hell I am or where I'm going" sound?

Now I throw in some supplementary bitches of my own:

1.   "That's a roger" and variants.
When I learned radio protocol (the hard way - USN 0
R or Roger meant received, and those who
tried using it otherwise got "scolded".
And we used R just once - none of this R R R R
garbage heard on the N bands (and elsewhere).
On the other hand, don't try misuse of R on a
traffic net except when NCS isn't listening.

2.   Whatinhell do these 10M denizens mean to say
when they actually preface and follow every comment
with "QSL". I always imagine they're begging me for
a QSL card, and since I have some I tell them if they
want a card I'm fine in most all callbooks and will be
happy to respond, so then they come back giving their
full mailing address (repeated at least 8 times with
Cincinnati given in varied phonetics numerous times,
and with several spellings, but it doesn't matter much
because it gives me time to return a phone call or two.)
To me QSL is the formal acknowledgment of message handling,
useful in traffic operation, CW.
But it sounds like QSL is the l0m (and spreading elsewhere)
phone equivalent of Ten-Four.

3.   The beginner has the bad habit of ending a phone
transmission by just stopping and letting go the button.
That wasn't too bad in the AM days, and works just fine
with QSK CW, but on SSB leads to more and more doubling.
I keep telling the obvious beginners to end each transmission
with "go" or "go ahead", but it's a one-ham crusade.

Let's see how far this discussion goes. Much opportunity
for violent flaming, and it should be obvious I'm asksing
for it.

Because magazines that live on ads don't say don't buy *anything*
                                                         ^^^^^^^

I like the local group with baby homebrew rigs to get started.
Works fine on CW - -
but all the beginners wanna work DX -
and how they go nuts with their first
VE, much less a DL - - or - - horror of
horrors - an African, a JA or a !!!UB5!

And how all the kids seem to read the ads and have poppa
convinced that they will be incorrigible delinquents if
they don't immediately get a ***K*E*N*W*O*O*D*** 440, and
it's gotta be ***N.E.W.**** in the box.  Never mind that
by any reasonable standards said 440 is a pretty crappyu
piece of equipment - - they like the fancy ADVERTISING
BLURBS and all the FANCY GADGETS that no one has yet found
a practical use for.  They think IT LOOKS PRETTY and they
```

GOTTA HAVE IT!

So isn't the whole discussion academic?

And a couple years premature?

As long as sunspots are in style and 10 is open
the new N's and T's are on 10 meter U.S.B. (not SSB)
calling CQ DX and **WORKING*** DL's and G"s and so
forth if on the W. coast, a steady diet of JA's and
VK's, and as far as the N CW bands are concerned, they
don't exist. Let's wait for 10 to go dead per
132 month cycle and *maybe* get some reconstituted
80, 40, and maybe 15 N / T CW action. It's not there
now (witness the Novice Roundup - a nice contest shot
to hell by Novice Enhancement.

Oh, well, there's always 14,000/.025, and 3767 when I wanna
work Phone.

Mr. Waters is quite correct. As a member of rec.org.sca, and quite a medieval
history nut, I might add that the "wonderful" Crusaders killed many Jews (in
those days under the protection of the Moslems!) and at one point even made war
and committed serious atrocities against their fellow Christians in Byzantium,
simply because they were "different" (and very rich!) much as Saddam now does to
his Kuwaiti cousins. As much as I love medieval romanticism, "Crusade" is a
very dirty word!

Beryllium oxide is only hazardous when it is in powdered form. My understanding is you could SWALLOW a chunk of it, and as long as it passed through the body without causing mechanical damage, it wouldn't hurt you.

The moral is don't crush it or try to drill or saw it.

I always recommend that people purchase a used rig to start, even if they plan to build. That way, they can operate while they get their homebrew gear going. When the home-built station is finished to your satisfaction, you can re-sell the used equipment for about the same price you paid for it.

A used Heathkit HW-100 goes for around $100-$150. It's a perfectly servicable SSB rig also usable on CW.

The Drake "4-line" is better, especially on CW. An R4A receiver, T4X transmitter, and AC-4 power supply can be had for around $200. A "B-line" (R4B/T4XB/AC4) is a bit more expensive, and a "C-line" (R4C/T4XC/AC4) runs in the $400 range. The A and B-line receivers come with all bandwidths installed; the R4C requires separate optional filters. (2.1 kHz SSB filter standard)

The older Japanese radios are also quite reasonable nowdays, expecially if you don't mind the prior-generation units with tubes in 'em.

The Trimble Navigation portable GPS receiver, a handheld device intended for small boat navigation and available in boat shops, is being used by U.S. troops. Trimble is manufacturing them as fast as possible, but can't keep up with the sudden demand. They're made in here in Silicon Valley. The militarized portable GPS receivers aren't available in quantity yet, so this commercial unit is being pressed into service.

It's a cute little device. It takes about 30 seconds for it to get a fix, it runs on batteries, and it's watertight. (It even floats.) Trimble doesn't promise accuracy better than a few hundred meters, though, so signal degradation for security reasons probably isn't an issue.

I am planning on buying a dual band radio soon...two weeks.
```

I am new to ham radio, in fact I don't have a license yet, waiting for
Feb. 14. Would users fill me in e-mail about the following brands:

```
Yaesu    ( Always heard you got what you pay for in this brand, but saw here
           on rec.ham-radio some Yaesu defenders)
Kenwood  ( Seems to have a lot of conveniences but doesn't open up for receive
           like the IC-24AT, and when hardware moded does it receive 902 to
           928? )
Icom     ( I like the IC-24AT scan modes, but it doesn't seem to stack up to
           the TH-77)
Standard ( Have heard they have an all band-radio in Japan, rumor)
```

Also, what can the Radio Shack pro-34 be modified to do? Is it easy to open
it up to receive the whole 800mhz band? What about 220? Can the memory be
expanded easily? How much memory, and in what memory 'bank' arrangement?
Can all these mods be done together?

Thanks!

Get a grip, Jim. Nobody's endangering anybody by discussing the capabilities of commercially-available electronic toys. The publishers of Jane's know far more about this stuff than we'll ever crowbar into a Usenet posting, and you can bet Saddam Hussein's been subscribing to Jane's since he was just a little dictator.

Dangerous secrets are marked so you can't mistake them for common knowledge, and I haven't seen any of those here.

Anyway, he probably knows the insides of every weapon we have, having got the info from the salesmen who work for the manufacturers of those weapons.

It's also pretty apparent that he's completely incapable of anything resembling effective military activity, anyway. I don't think it will hurt us to let him know the exact coordinates of the target on which he's standing.

Christopher.Boone@f8325.n106.z1.fidonet.org (WB5ITT) says:

>I doesnt matter WHO the operators are...JUST the station callsign!!!!!
>I would KEEP the card as it is vaild!!! You worked YOUR STATION with another
>op on it..but that IS valid!!

I'm not sure what this is in reply to, but I think we have sorted it out now. Obviously, what matters as far as DXCC et al. is concerned is the call on the QSL card, which is the call that was transmitted at the time of the QSO; this can be your station's (whether you are physically there or not), and it can be your call (whether you are at your station or someone else's) - with the usual disclaimers about everyone staying within their license class privileges etc.

So if you own a station you can work yourself from Albania, if you don't you can't. If you don't own a station you can work Albania with your call from another station.

The next topic was going to be "can I use two different calls in a contest if I don't plan to submit both logs?" but perhaps we've had enough of this for now...

I have a device that transmits AM telemetry at 49 Mhz. I would like to build a cheap and dirty, low current receiver for receiving the telemetry. I recall that in the old days before rice box was another politically incorrect word - even before there were rice boxes - the home brew receiver of choice for VHF AM was the super regen. In fact the "Benton Harbour Lunchbox" was a Xtal controlled AM TX with a super regen receiver. Those were the days when rather than have your own repeater, every amateur could have his own frequency.

But I digress, waffle and reminisce like an old fart, I will be advocating CW next.

What I want is this: Does anyone have an up to date schematic for one of these beasts? Does anyone make kits? Ramsey?

I have a schematic (really and application note) from the 1978 ARRL Handbook.

With all this novice/no-code tech homebrew chatter, how about an updated version of the Benton Harbour Lunchbox (both the "Twoer" and "Sixer"). Not much simpler or cheaper than that for a homebrew project.

I suppose now that Benton Harbour has suffered such devastating urban decay someone is going to take me to task for being so insensitive as use the words Benton Harbour and lunchbox in the same sentance.

I know.  I have a friend in Dallas who sent me one for Christmas. (Stuffed
toy type). She also sent me a box of armadillo doodoo (praline candy -
delicious) and armadillo canned meat ("You COULD eat it, but I don't
recommend it! After all, it was scraped off a Texas highway after being run
over by an 18 wheeler.")

If any of Saddam's minions is smart enough to set up a Unix system, set up
news and get a news feed, then surely Saddam already knows about any plan
to degrade GPS signals during a crisis.

If Saddam is treating Usenet as a reliable information source then he's even
dumber than his worst critics think. :-)

Agreed. Non-professionals in the intelligence/espionage field assume too much. We all have difficulty dealing with the concept that there are important things we know nothing about. This is related to the not unnatural chauvinism many feel toward their own chosen profession.

Besides, even if the enemy finds out by other means, why make it easy for them? Make him fight for everything he learns.

Moreover, at present his chief source of foreign intelligence appears to be CNN which ain't exactly high-tech. [:-)

> This is not a trivial little flame - you never know what someone knows
> until
> they give you the details.

Moreover, every little piece you provide contributes to a process of selection by elimination. Telling the enemy how something is NOT done can be as important as telling him how it IS done.

I'm afraid this has the potential for generating a major flare on the surface of the network. A proton event should hit the net within 24-48 hours with a resulting degradation of communication on all paths.

>   Freedom of Speech and Amateur Radio
>   -----------------------------------
Major flare alert.... The K is rising....

> What attraction is
>there for the general public to spend thousands of dollars on an amateur
>radio station just to be able to say "5-9, New York" to a Russian ham ?

If the writer of this has to ask this question he can't possibly be active on the bands. I'm sure the many DX friends I have made over the years would be puzzled by this assertion.

>   Section 97.117 degraded amateur communications to unimportant
>remarks of a personal character -- remarks so unimportant you wouldn't even
>waste a phone call on them. Thus, there is a built-in damper on any
>interesting communication on the amateur bands.

Nonsense. The FCC rules have for the most part saved the Amateur Radio Service from degrading into uninteresting political/religious propagandizing.

Any conversation I have to pick up the phone for is one I would rather avoid. That's uninteresting. There is no damper on interesting communication unless you define as "interesting" some of the narrow-minded soap-box ranting you can find on some of bands today to the detriment of Amateur Radio and in violation of the rules.

>   Now, I know that the genesis of this provision is an ITU regulation,
>and I understand the politics of protecting common carriers from lost
>revenue. I also am aware that this regulation is violated every minute of
>every day. But it seems to me that amateur radio will never thrive as long
>as there is a gag order on intelligent conversation.

Amateur radio is doing just fine without this attack on regulations that have served to protect it from people who would like to use it to advance their own personal agenda. If you don't think Amateur Radio is thriving right now you've got glue in your headphones. The local clubs, repeater groups, nets in my area area are thriving with activity. The idea that Amateur Radio needs "saving" is always pushed by those who have the "solution". Their own personal agenda.

>   I think that we wouldn't have to be concerned about losing amateur
>frequencies if we could use the frequencies for more than experiments and
>contests.

The fastest way to lose all of our spectrum is to turn Amateur Radio into an international propaganda service.

>Section 97.1 of the amateur rules provides that one of the purposes
>of the amateur service is "continuation and extension of the amateur's unique
>ability to enhance international goodwill." How can we accomplish that
>through "remarks of a personal character for which, by reason of their
>unimportance, recourse to the public telecommunications service is not
>justified."?

International goodwill is enhanced by the "personal character" of the communications. International goodwill will be destroyed when this close personal relationship is replaced by a confrontational one.

>   I think that we should be going into WARC-92 with a proposal to
>eliminate this provision. In addition, we should esamine carefully the
>restriction on free speech which the FCC imposes on domestic amateur
>communication.

You can't yell "fire" in a crowded room because of the damage that act would cause and you can't yell other things into a microphone because of the damage that would cause. Same deal me bucko.

>   For example in &97.113, it says:"No station shall transmit communi-
>cations as an alternative to other authorized radio services, except as
>necessary to providing emergency communications." Under this regulation,
>the existance of call-in talk radio programs on broadcast station would seem
>to prohibit most discussion nets, since the net control is performing the same
>role as a Larry King in that type of net.

Somebody looking for a way use Amateur Radio as a cheap forum for their particular political/religious agenda?

>   In fact, just about all of &97.113 is of questionable value.

Questionable value to you. It protects me from having to listen to this kind of drivel on the air.

>   While I certainly agree that communications for hire, and obscene
>communications should be prohibited on the amateur bands,

Political/religious pontificating is "obscene" to me. So the writer agrees that it has no place in Amateur Radio.

>it is not clear
>to me why the playing of music should be prohibited in a two-way communi-
>cation.

Ever hear of copyright laws? Is this really an "attorney" writing this?

>The existence of regulations like 97.113 and 97.117 has turned many
>hams into amateur attorneys,

Now you've got me. If this is true I will support any action to prevent this from happening.

> having to interpret the rules to decide what
> speech is permissible and what is not.

There should be no trouble using common sense to decide what is in the best interest of the Amateur Radio Service.

>   The truth is that amateur radio will not thrive untill all speech of a
>non-obscene and non-commercial nature is permitted on the amateur bands.
>What better way to demonstrate to the newly-democratic Eastern bloc the
>freedom of speech which has been the glory of this nation than to fight at
>WARC-92 for the freedom of speech in amateur radio. When hams can legally
>have intelligent discussions on HF, interest in amateur radio will rebound.
>When we can legally offer new hams more than just call signs and signal
>reports, there will be a good reason to get involved in amateur radio --
>stimulating conversation with people all over the world. And that's the
>reason many of us became involved in amateur radio to begin with.

I'm speechless...
>
>FRANK TERRANELLA is an attorney and amateur radio operator.

I've been trying to behave folks...I really have. But this one really steams my finals. The mess on 14.313 and several other incidents on the bands that have attracted the attention of the FCC are a direct result of a failure on the part of those involved to follow the very simple rules found in Part 97.

When you attract the attention of the FCC you cause them more work. When you cause them more work, you cost them money. When you cost them money they will have to look for ways to reduce their costs. Get my drift?

I followed a posted modification for the u2 for extended TX capability. The mod worked fine, extending the range satisfactorily but had the unfortunate side effect of eliminating Duplex for repeater operation. The duplex switch has no effect, it is stuck as a simplex radio now.

Anybody hacked with u's before?

Anybody tried this mod without this happening? maybe I really did
break something?

If you find a source for that KWM-2A kit, please let me know. Of course, alignment might be a problem :-)

I was looking for a Collins desktop kilowatt transmitter last year (the KWS-1, separate exciter/power supply, pair of 4CX250 finals). I talked to several people who were selling older Collins stuff, including several KWS-1s. They said that they had received several calls from JA hams who wanted the rigs very badly. Seems that the older Collins rigs are in great demand in JA-land. Now, I wonder what THEY know that WE don't...

After the gulf war is over, is it likely that there will be massive dumping of used civilian GPS receivers onto the market? Previous messages stated that the armed forces had to rush out and buy lots of civilian models and ship them to the gulf; once they get their own models purchased, I would presume they would have no use for all the non-military units. This might take a year or two, and they might hang on to *some* of the civilian units for training. Any guesses?

It's fair to think of GPS as two signals. One for "normal" users... like
someone guiding a fishing boat, etc... and one for military users.
With the military signal you can measure *extremely* accurately... look
at what the Tomahawk missles did. With the normal signal you can get near
a major football stadium... as opposed to the left or right upright in

one endzone.

Beleive it or not... at one point the US Coast Guard couldn't get access to the military signal. Their solution was to create something called differential GPS. They measure very precisely --once-- the location of a fixed land site. This site radiates an accurate signal that when combined with the normal GPS signal results in Coast Guard being able to pinpoint a spot very accurately again. Since the Coast Guard has a limited operating area this works quite well.

The normal signal is really the military signal with noise mixed in. I can't really see them degrading the normal signal further. After all the Iraqi army doesn't seem to have anything that uses it. SCUDs seem to have a hard time hitting the country they're aimed at much less a pinpoint target (several SCUDs went harmlessly out to sea... unless you're a fish... but then fish don't vote :-))

There's nothing secret in this. Attending one trade show on this kind of technology will give you what I've said... and CNN has already told the world how accurate our missles are (which is perhaps the most important secret). A trade show I've attended on several occasions (it's a yearly event) is held in Washington DC. You'll see foriegn diplomats going up and down the isles picking up literature... communist block contries too... during the cold war!!!

What really intrigues me is how they got the locations so accurately. From a satellite picture??? Spies? Israeli's? It's one thing to measure it with a GPS receiver... it's quite another to calculate it. Remeber even though it's land it moves just like the ocean with tides, wobble of the earth, etc, and there are probably very few accurately measured landmarks there... not ones that will show up in important military photos.

PS. The Soviets have their own GPS system too. I believe it's called GOSS. No, I don't know what it stands for.

I like Doug DeMaw's book, "W1FB's Help For New Hams." I strongly agree with a major point in his book, which is that a lot a "ham speak" is both unnecessary and stupid.

For example, why use Q abbreiviations on phone? Why say "There's a lot of QSB on the band", when you can just say "Your signals are fading." I prefer hearing "I'm getting interference from a nearby station" to "there's a lot of QRM out there, old man." I don't know if he's saying "QRN" or "QRM", so I don't know if we should just change to another frequency, or what.

Hams tend to use English in an interesting way. 2m mobile conversations often end with "I'm destinated now." The word "destinated" does not appear in the dictionary.

I'm especially irritated with the term "seventy-threes". This term means "best regards", so you shouldn't put an "s" on the end of it. The worst is "the very best of seventy-threes, old man", which means "the very best of best regards-es." Use a simple "seven-three", "seventy-three", or better yet, just say "nice chatting with you."

Some hams get offended when people use CB lingo on the air, but they should look at their own lingo first. Which is worse, this:

> Breaker, breaker, good buddy, hey Spacman, you got your ears on?

or:

> We've got QSB over there, old man, and some QRM, so we'd better QSY. My QTH is mobile, and I'm almost destinated over here, so I'll have to say the very best of seventy-threes to you, old man.

Lingo like this does not exactly encourage newcomers to the hobby. Why not speak in plan English when we can?

reed@mozart.amd.com (David F. Reed) says:

>My experience with the ARRL (and no, I don't want a flame war, but...) is
>that they count the station NOT the operator for the award. I have had trouble
>in the past getting cards/awards that spanned a call-sign change because of
>this.

I don't understand this. The DXCC and other awards go to the person whose call is on the QSL submitted cards. In my case (see below), this is the operator and not the station. If you change calls (by upgrading) the cards still count towards DXCC endorsements, so perhaps what you mean is that the award goes to the person, not the station?

If the awards go to the station, then I am in trouble because I have a lot of QSL cards with my call on them, but I don't own a station (I don't even have an HT, in fact I don't even have a baseball cap with my call on it. I know, I'm despicable).   What I do is guest op from our campus club station. The station and I both have Extra class privileges, and I will often work DX with both calls, after a decent interval of a few minutes or a few QSOs, have intervened. Yes, this is probably unfair to those in the pile-up running a microwatt to an indoor vertical, but I don't think think it's illegal or even too immoral.

Anyway, the consensus of postings seems to be that if I owned a real station, someone else could go and operate it using my call, and I (as the DX station) could work myself, but since I don't own a real station, I can't legally work myself from Albania. This sounds quite fair, by the way, I'm not complaining - but I think I'll cancel my ZA trip after all.

Ah, but how about a local with a good station lends his station to me,

and then I lend it to someone else so that they can use my call from
it, now can I work myself?   I love this.

I'm afraid this has the potential for generating a major flare on the surface
of the network. A proton event should hit the net within 24-48 hours with
a resulting degradation of communication on all paths.

>   Freedom of Speech and Amateur Radio
>   ----------------------------------
Major flare alert.... The K is rising....

> What attraction is
>there for the general public to spend thousands of dollars on an amateur
>radio station just to be able to say "5-9, New York" to a Russian ham ?

If the writer of this has to ask this question he can't possibly be active
on the bands. I'm sure the many DX friends I have made over the years would
be puzzled by this assertion.

>   Section 97.117 degraded amateur communications to unimportant

>remarks of a personal character -- remarks so unimportant you wouldn't even
>waste a phone call on them. Thus, there is a built-in damper on any
>interesting communication on the amateur bands.

Nonsense. The FCC rules have for the most part saved the Amateur Radio Service
from degrading into uninteresting political/religious propagandizing.

Any conversation I have to pick up the phone for is one I would
rather avoid. That's uninteresting. There is no damper on interesting
communication unless you define as "interesting" some of the narrow-minded
soap-box ranting you can find on some of bands today to the detriment of
Amateur Radio and in violation of the rules.

>   Now, I know that the genesis of this provision is an ITU regulation,
>and I understand the politics of protecting common carriers from lost
>revenue. I also am aware that this regulation is violated every minute of
>every day. But it seems to me that amateur radio will never thrive as long
>as there is a gag order on intelligent conversation.

Amateur radio is doing just fine without this attack on regulations that have
served to protect it from people who would like to use it to advance their own
personal agenda. If you don't think Amateur Radio is thriving right now you've
got glue in your headphones. The local clubs, repeater groups, nets in my area
area are thriving with activity. The idea that Amateur Radio needs "saving"
is always pushed by those who have the "solution". Their own personal agenda.

>   I think that we wouldn't have to be concerned about losing amateur
>frequencies if we could use the frequencies for more than experiments and
>contests.

The fastest way to lose all of our spectrum is to turn Amateur Radio into an
international propaganda service.

>Section 97.1 of the amateur rules provides that one of the purposes
>of the amateur service is "continuation and extension of the amateur's unique
>ability to enhance international goodwill." How can we accomplish that
>through "remarks of a personal character for which, by reason of their
>unimportance, recourse to the public telecommunications service is not
>justified."?

International goodwill is enhanced by the "personal character" of the communications. International goodwill will be destroyed when this close personal
relationship is replaced by a confrontational one.

>   I think that we should be going into WARC-92 with a proposal to
>eliminate this provision. In addition, we should esamine carefully the
>restriction on free speech which the FCC imposes on domestic amateur
>communication.

You can't yell "fire" in a crowded room because of the damage that act would
cause and you can't yell other things into a microphone because of the damage
that would cause. Same deal me bucko.

> For example in &97.113, it says:"No station shall transmit communications as an alternative to other authorized radio services, except as necessary to providing emergency communications." Under this regulation, the existance of call-in talk radio programs on broadcast station would seem to prohibit most discussion nets, since the net control is performing the same role as a Larry King in that type of net.

Somebody looking for a way use Amateur Radio as a cheap forum for their particular political/religious agenda?

> In fact, just about all of &97.113 is of questionable value.

Questionable value to you. It protects me from having to listen to this kind of drivel on the air.

> While I certainly agree that communications for hire, and obscene communications should be prohibited on the amateur bands,

Political/religious pontificating is "obscene" to me. So the writer agrees that it has no place in Amateur Radio.

> it is not clear
> to me why the playing of music should be prohibited in a two-way communication.

Ever hear of copyright laws? Is this really an "attorney" writing this?

> The existence of regulations like 97.113 and 97.117 has turned many hams into amateur attorneys,

Now you've got me. If this is true I will support any action to prevent this from happening.

> having to interpret the rules to decide what
> speech is permissible and what is not.

There should be no trouble using common sense to decide what is in the best interest of the Amateur Radio Service.

> The truth is that amateur radio will not thrive untill all speech of a non-obscene and non-commercial nature is permitted on the amateur bands. What better way to demonstrate to the newly-democratic Eastern bloc the freedom of speech which has been the glory of this nation than to fight at WARC-92 for the freedom of speech in amateur radio. When hams can legally have intelligent discussions on HF, interest in amateur radio will rebound. When we can legally offer new hams more than just call signs and signal reports, there will be a good reason to get involved in amateur radio -- stimulating conversation with people all over the world. And that's the reason many of us became involved in amateur radio to begin with.

I'm speechless...

>
> FRANK TERRANELLA is an attorney and amateur radio operator.

I've been trying to behave folks...I really have. But this one really steams my finals. The mess on 14.313 and several other incidents on the bands that have attracted the attention of the FCC are a direct result of a failure on the part of those involved to follow the very simple rules found in Part 97.

When you attract the attention of the FCC you cause them more work. When you cause them more work, you cost them money. When you cost them money they will have to look for ways to reduce their costs. Get my drift?

>number to receive and transmit frequencies?
>
>Jim Kirkpatrick   WB7BUP   JIMKIRK@CORRAL.UWYO.EDU

Well, it's somewhat complex, but I'll try to explain. Each cell site has either 15 or 16 channels allocated to it. There are a total of 666 total frequencies (errie, isn't it?). There are, by FCC regs, always 2 competing systems - one called the A system with is owned and operated by a company that is normally NOT involved with landlane phone service, and a B company that is involved with normal landline phone service. Each (A and B) has 333 channels, 21 channel blocks. All the frequencies for one of the 21 channel blocks is used at a particular cell site.

The channels are numbered consecutively from 1 to 16 (or 15). The Tx and Rx frequencies are evenly spaced by 630 KHz with respect to eachother. Each of the Tx/Rx pairs is given a frequency designator, numbered 1 to 666. Thus, each of the 1-to-16 channel numbers corresponds to a frequency designator, each being 21 frequency numbers apart. Let me give you an example and it might make it easier to understand:

Cell #1 - Band A

Channel	Freq	Tx	Rx
1	333	879.990	834.990
2	312	879.360	834.360
3	291	878.730	833.730
..	..	..	..

Spacing: 21 630 KHz 630KHz

To figure out all of the Tx/Rx pairs for a given cell site, you only need to know one of the Frequency designators in the cell. The channel 1's for system A start at 333 and go down; the channel 1's for system B start at 334 and go up. In the above example, in system A, the Tx/Rx frequencies go down; in system B they go up (with respect to the channel number).

This probably isn't making a whole lot of sense, but in reality, the band plan is very well organized. It would be easy to write "formulas" to compute each of the frequencies/channel numbers/etc. for every cell.

>FRANK TERRANELLA is an attorney and amateur radio operator.

I think that there is room for some political discussion between two well-meaning and behaving Amateurs, regardless of their respective countries.
I DO think that the bounds of friendship would increase EVEN if the Amateurs disagree.

The current rules are extremely oppressive and DO limit freedom of speech unnecessarily.
Thank you for posting this thought-provoking article.

Jim Kirkpatrick   WB7BUP   JIMKIRK@CORRAL.UWYO.EDU, writes to ask about cellular channel numbering vs frequency.

The formula for cellular frequencies vs channel number, N, is as follows:

1<=N<=799 ;   0.03N + 825 MHz for mobile xmit;
990<=N<=1023   0.03(N-1023) + 825   MHz also for mobile xmit;

Base station xmit frequencies are 45 MHz higher than corresponding mobile xmit.

Source: EIA/TIA -552

The peculiar numbering scheme is an artifact of the way the FCC allocated spectrum to the cellular service. First, a total of 40 MHz was allocated to be equally divided between two service providers in each service area. Then the FCC allocated another 10 MHz to the service, but some on the high side of the original allocation and some on the low side. The numbering of channels got screwed up in the process.

Hope this answers your question.

<engle@wdl1.wdl.fac.com (David Engle)> David says:

Subject: Re: Omni vs beam antennas.

>While not I am not sure what exactly the theory says for each case of a "hidden" transmitter, I can relate some of my experiences (Which tend to support the omni approach).

(some deleted)

>I have good connectivity to about 50% of the other users. I was using an omni antenna and running about 10 watts. Signals at both ends were full

(some deleted)

>I got an amplifier and used that with the beam. I did not notice any significant difference in my drop out rate with the amplifier.
>
>Next I put up an omni gain antenna, outside, higher and in the clear. I disconnected the amplifier and ran just this configuration for a while. This configuration stayed connected longer (when a greater quantity of users came on) that that of the beam. I now found I would get dropped only when the user community went to more than ~22 users.

This is starting to sound vaguely familiar, sort of like a voice from the dim past.

>Next I rolled out the bigger hammer again. Presto, I now stay connected substantially longer that ever before (even up to ~25 users). Reflection shows that my station needed to heard by others to keep from being collided with, rather than just having the loudest signal at the central node. This is just what the theory says, nice huh?
>
>I found the answer to keeping connected in the face of an "overloaded" system to be going to more power with the omni gain antenna. The beam was definitely a detraction in my situation. Now, if a station were in a "hole" and truly isolated from the rest of the community, this would probably not be the optimum situation.

Now I know where I heard something like this! On the "Citizens Band". Of course, the next step, in the event one continues to get bumped off, is to go to a couple hundred watts, or, heck, just hit it with a gallon or two--just to make sure, you know?   :)

Dave, this is not a flame attack; and I'm sure that your motive is pure.
I just couldn't help noticing the logic parallel.

73,
Dube   N5PDK
